RURAL NEW-YORKER

TWO DOLLARS A YEAR.

"PROGRESS AND IMPROVEMENT."

(SINGLE NO. FIVE CENTS.)

VOL. IX. NO. 44.

ROCHESTER, N. Y.,—SATURDAY, OCTOBER 30, 1858.

{WHOLE NO. 460.

MOORE'S RURAL NEW-YORKER,
AN ORIGINAL WEEKLY
Agricultural, Literary and Family Newspaper.
CONDUCTED BY D. D. T. MOORE,
WITH AN ABLE CORPS OF ASSISTANT EDITORS.

THE RURAL NEW-YORKER is designed to be unsurpassed in Value, Purity, Usefulness and Variety of Contents, and unique and beautiful in Appearance. Its Conductor devotes his personal attention to the supervision of its various departments, and earnestly labors to render the RURAL an eminently Reliable Guide on the important Practical, Scientific and other Subjects intimately connected with the business of those whose interests it valuably advocates. It embraces the more Agricultural, Horticultural, Scientific, Educational, Literary and News Matter, interspersed with appropriate and beautiful Engravings, thus making it a most complete AGRICULTURAL, LITERARY AND FAMILY JOURNAL in America.

All communications and business letters should be addressed to D. D. T. MOORE, Rochester, N. Y.

For Terms and other particulars, see last page.

Rural New-Yorker.

NEW YORK STATE FAIR.

DISCUSSION ON CORN CULTURE.

AFTER the interesting discussion at the State Fair, on barley, which we gave last week, the subject of corn and its culture was taken up. T. C. PETERS said he found the best practice to be to spread manure in the fall, plow late in the spring, about four inches deep, roll, drag and plant immediately. His land was a gravelly loam. Planted about the 20th of May, four feet each way, and obtained from 50 to 60 bushels an acre, of the eight-rowed variety.

G. GEORGE commenced farming when 21 years old. Had learned that a course of farming that would pay one man would ruin another. Neither deep nor shallow plowing could be recommended for all land. Some light land might not be benefited by deep plowing, while in other land of a heavier character it was absolutely necessary to secure a good crop.

E. CORNELL, of Tompkins county, believed in high manuring and deep cultivation for corn.—Had grown 1,600 bushels of shelled corn on four acres in four years. Had grown 123 bushels on an acre, weighing 56 pounds to the bushel, as the result of manuring and deep and thorough culture. Mr. C. said in answer to a question from Mr. GEORGE that the crop was measured in the fall.—Mr. G. said that corn will shrink from 15 to 20 per cent. between fall and spring. He had been trying all his life to raise a hundred bushels of shelled corn to the acre and had not done it, and would go a long journey to see such a crop.

J. J. THOMAS, had tried some experiments to ascertain the best distance to plant corn to secure the largest crop. He found that corn planted three feet by eighteen inches would produce one-third more corn than if planted three feet each way.—Several other gentlemen agreed with Mr. T. that this way of planting would give a large yield, but whether sufficient to pay for the extra labor required in its culture was a matter of some question.

Mr. MATTOON, of Oneida county, had been taught the necessity of deep plowing, by experience.—Had raised 500 bushels of sound ears upon five acres by plowing from 10 to 12 inches deep, where 50 bushels would not have grown by shallow plowing. He got rid of the wire-worm by using the Michigan plow, turning the sod down deep and covering it with the second share, about 10 inches deep. Preferred to mix seed. Grew a mixture of Dutton, Yellow, Flint and Red Streak.

T. C. PETERS said it had been stated that our agricultural products were decreasing, but he thought it a mistake. Our population is becoming more dense along the Railroads and grain culture is lessening. He spoke of the value of agricultural statistics, and thought assessors could do this work. He sowed a plot of ground, in drills, with Ohio corn for fodder and obtained at the rate of about 40,000 pounds to the acre.

GEORGE CLARK, of Onondaga, believed that Indian corn as a basis of feeding animals was of more importance than any or all roots. Several other gentlemen expressed the same opinion, though no experiments were given as a foundation of these opinions, without which the bare assertion is not of much account.

JOHN L. PECKHAM, of Ulster, inquired if corn was a profitable crop for the dairymen to grow.—To this there was a general affirmative answer.

Mr. BROWN, of Onondaga, raised corn much cheaper now than he did fifteen years ago. Plow in the fall eight or ten inches deep—sow gravelly loam. Mellow it in the spring with a cultivator, and do most of the cultivation with the same implement. Grew near 100 bushels per acre this year, and it would cost me over 10¢ per bushel. Think farmers would do well to depend more upon corn. Manure by top-dressing with compost, using salt, plaster, and unslacked ashes with barn-yard manure.

Mr. BROWN, of Madison, said lime had been recommended for killing the wire-worm. He had come to the conclusion that it would not do it. Had used lime, ashes and plaster in the hill and all would not kill them. They will live in wet lime.—Had tried various modes and preferred to top corn. Mr. OLDS, of Herkimer, thought there was but one right way to cure corn, and that was to pull it up by the roots.

B. F. CARPENTER, of Chemung, says stacks can be made over a horse which had been described in the RURAL NEW-YORKER, better than any other way. A sample of butter made from sugar-cane feed was pronounced very superior. Cows will eat the cane when fall fed with grass. Prefer to cultivate my corn planted in drills for fodder, dropping very close, taking three and a half bushels of seed. Cut and fed sorghum the first of September.

Prof. WILSON, of Iowa, said, if we cannot grow corn with you, we can beat you in growing grass. We can make, as an average crop, from four to five tons per acre of good hay from the Hungarian grass, and eight tons per acre has been made. It is as easily cured as timothy. It is sown in the spring, say May, and in August. It is preferred to timothy, and it is the most reliable grass for the prairie for hay, and the after growth makes good pasture. We sow one-third of a bushel per acre. It has been mostly grown upon new lands.

The Corn Horse referred to by Mr. CARPENTER, we presume, is the one published in the RURAL of 1855, as it has been very generally used, and is well liked. Indeed, since its first publication, correspondents have several times sent us descriptions of this implement, as something new and valuable, not knowing the source from which it originated. One of these recently received, as it contains a description of the manner of construction, we give our readers, so that all may have the necessary information, without hunting over their back volumes.

Messrs. Eds.:—Last fall, while traveling in Michigan, I saw an instrument used in cutting up corn, called the Corn Horse, and on my return home I made one, and found it to be a saving of at least one-third in time and labor. In its construction, is used a pole of about 12 feet in length, being 4 inches in diameter at the large end, in which is placed two legs, wide enough apart at the bottom to be admitted between the rows of corn, and in length according to the height of the corn, say three or four feet, while the other end rests on the ground. About three feet back of the legs is a 14 inch hole, through which is placed a rod four or five feet long, that is easily admitted and removed, and is horizontal when the horse is standing, as shown in the engraving.

The horse is placed in the centre of the number of rows desired to be cut, the corn is placed in the four corners around the rod, the shock is then tied, the horizontal rod removed, and the horse drawn ahead. The rod is replaced, when it is ready for forming another shock. All will at once see its utility; at least it will cost nothing to try it.—B., Sheldrake, Seneca Co., N. Y.

EUROPEAN AGRICULTURE.

JUDGING from the tone of recent contributions to the RURAL, the authors being practical farmers, the subject of Permanent Pastures seems to be attracting more than ordinary attention—gaining a consideration which would seem likely to lead to their more general adoption by American agriculturists. In a recent issue of the Royal Ag. Society's Journal, Grass Land Management forms a characteristic feature—five essays being devoted to this specialty—and we purpose to condense therefrom a few of the leading thoughts and facts presented.

NEWLY-LAID DOWN GRASS LAND.—The paper of Mr. H. S. THOMPSON, Chairman of the Journal Committee, discusses the best mode of treating newly-laid down grass for the production of a good permanent pasture. After long experience and repeated failures in the attempt to establish a pasture by folding sheep year after year on young grass, Mr. T. became satisfied "that to graze sheep on young seeds intended for permanent pasture was a mistake, and had been, in all probability, the cause of previous failures. Had never succeeded under such course of feeding; but since making a rule to exclude sheep for some years from newly-laid grass, during the season of active growth, had not failed in a single instance." The plan of Mr. THOMPSON is to mow the first year, and as soon as the hay is removed, to give a good dressing of barn-yard manure, and then, for some years, to pasture it with cattle, beginning, for the first year or

FAWKES' STEAM PLOW.

two, with young stock, until the turf is close and strong enough to bear the treading of heavy cattle.

The essays of Mr. DIXON,—for which the Society awarded a premium,—are confined to the effects of under-draining, draining, &c. here and there, etc. One of the farms inspected by Mr. DIXON, consisting of 98 acres, had been frequently manured, boiled bones to the value of \$1,250 spread upon it, but without any apparent increase in vegetation, or change in the quality of the land. At the period of his first visit, (1838) did not believe that 300 pounds of hay could be obtained from an acre.—Draining was commenced, and the year following (1839) the stock on the farm, which had previously consisted of four cows, was doubled. In 1842 the dairy stock was further increased to twenty-four cows, and in the autumn eighty sheep were put on the land to consume the superabundant grass.—The draining was not thorough, for surface water was apparent in many places, yet sufficient facts were elicited to prove the advantages derivable from a system of water conduits.

In reference to liming, Mr. DIXON states that he was employed to bring up several hundred acres of land, which was completely worn out,—consisting of "a number of small farms, which had been purchased by a gentleman who desired to see the land of his early days wear a more pleasing appearance." The soil, for the most part, lay on poor clay or slate. Rather extensive draining was done on the clay land; and the material thrown out of the drains, being of a soft and cohesive character, was not returned. This was mixed with lime in equal quantities—the object being to destroy or reduce the nature of the clay—and in about fourteen days the lime nearly burned the clay. The compost was then turned over altogether, and was completely comminuted. In due course it was applied to the land, and in a few weeks there was ample evidence that the practice was correct. The compost acted sooner than lime alone, and to some extent more effective. The amount of lime used varied from eight to nine tons per acre. In one year after the lime had been applied, 10s. to 15s. per acre advance in rent was easily obtained.

PROPER TIME TO FELL TIMBER.—An article upon this subject, in one of our American Agricultural Journals, was copied by the London *Gardener's Chronicle*, and the opinions of British foresters were sought upon the American practice of felling oak and other timber trees while the leaf was in full vigor. In response thereto, Wm. MASTERS, of the "Exotic Nursery," writes to the *Chronicle*, supporting the American theory. In his argument he adverts to pieces of sound oak removed from the tower of the Canterbury Cathedral, which must have been placed there with the building, seven hundred years previous. "It was impossible," remarks Mr. M., "to state at what precise period of the year this timber was cut; but, as the bark was still on, it could not have been in June—as is now the English practice—it might have been in mid-winter, or it might have been after the leaves had performed their office in a great measure, and before their fall. I am led to this surmise by the fact that when timber is cut in August and September, it does not pour out its sap, the watery particles being at that time in the leaves and smaller branches, and not in the more compact part of the tree, and by severing the branches and leaves from the trunk you prevent its return. It is an indisputable fact, that in ship building it often occurs that before the vessel is completed some portions have decayed by dry rot. Now, without dogmatizing upon the matter, I would surmise that if the timber had been cut

when it contained the smallest portion of sap, such a result would have been far less likely to have occurred. It has long been a practice with builders to employ green elm for foundations where the ground is treacherous. Why use elm cut down when in full leaf if it was not less likely to decay than elm cut down at the usual time?

PLOWING BY STEAM.

When chronicling some of the experiments made with Steam Plows in England, we expressed the opinion that, "no land in the world is better adapted to steam plowing than the boundless prairies of the West. In ten years from now, scores of Steam Plows may be engaged in turning over these rich soils." Breaking up the prairie is a serious and costly work for the new settler. It can be done with no ordinary team which he can keep, therefore he is compelled to employ those who have proper teams and plows, and make this their business. The price paid for this work is generally about three dollars per acre, so that the new settler on the prairie who breaks up one hundred acres, has to invest \$300 for plowing, although himself and boys may stand idly by and look on. Then fencing on the prairie is costly, as is building, and he will need a "smart pile" of cash to get a good start. We have seen the crops of the farmer destroyed for want of fences and barns,—his cattle unsheathed from the terrible winds that sweep unobstructed over the boundless prairies,—and when we inquired the cause of this, learned that the unexpectedly large outlay for building a cottage and breaking up, had exhausted the means that was designed to build barns and fences. Any invention that will lessen the cost of breaking up and fencing, will be of incalculable benefit to the Prairie States. It is for this reason that we have anxiously looked for and desired the success of the Steam Plow.

The Executive Board of the Agricultural Society of Illinois seems to have taken the same view of the matter, and accordingly offered "a premium of five thousand dollars for the best steam engine suitable for plowing and other work, the practicability to be decided by the Board." In view of the encouragement thus offered, Mr. J. W. FAWKES, of Lancaster, Pa., exhibited and worked a Steam Plow at the late State Fair at Centerville, an engraving of which we give from *Emery's Journal*. We copy our description of the machine and its operation from the *Chicago Press* and other journals, all of which are loud in its praise.

The engraving shows the general features of the engine and plows, and can hardly be misunderstood. The large or propelling wheel in the centre is barrel-shaped, which facilitates turning corners very much; it is about six feet long, and five feet in diameter, thus presenting a great amount of surface to the ground in traveling; the forward wheels are of about the same diameter and one foot surface, and are the guiding wheels, being moved by the operator by a screw gear. The plows are hung in a frame at the rear of the engine—each one independent of the other, and drawn by separate rods attached to rear of the engine. In order to keep the plows close to their work in uneven or irregular surfaces, strong coiled springs are placed on the suspending rods. With the ropes and pulleys, the whole gang of plows are instantly raised from the ground and let down again.

It draws six plows, cutting a foot each, attached in a frame, and so regulated by spiral springs that they yield to any extraordinary obstruction. As

there was no stubble field near, it was concluded to make trial on the unbroken prairie. This was now baked so bad by drouth, that the prairie-breaking plows would not run in it, and the trial of sod plows was abandoned in consequence. Notwithstanding this fact, the inventor was so confident of success, that he gave the order to put the plows to work in this almost impervious soil.—After a little delay in regulating to this brick-like surface, the engine moved forward, when six furrows were turned side by side, in the most workmanlike manner. The excitement of the crowd was beyond control, and their shouts and wild huzzas echoed far over the prairie, as there beneath the smiling Autumn sun, lay the first furrow turned by steam on the broad prairies of the mighty West.

The goal was won. Steam had conquered the face of nature, and the Steam Plow had become a fact; it was working over the rich, rolling prairies of "Egypt," and turning up its wealth of nutritious elements for the growth of the cereal and pomonal products—self-moving, and containing a power unequalled to turn up the lower strata of soil, so rich in potash, in phosphates, in silica and other essential elements of vegetable growth. The long line of matchless furrows parted the crowd, and lay between the moving masses like a line of silver wove in the gray setting of the prairie. Amid the excitement the inventor remained calm; it was enough for him to hear the glad shouts of victory which rent the air—for this he had toiled—for this his hands had become hardened, and his face made awarthy over the glowing iron, out of which he forged the muscles of his iron steed of the prairie.

Mr. FAWKES and others were called out by the crowd, and made brief speeches. Mr. COLEMAN, a member of the Board, spoke of the success of the Steam Plow now witnessed, as marking a new era in the world's progress, and declared that the great enterprise of FAWKES, may be placed side by side with the steam engine, the steamboat, the locomotive, the cotton gin, and the telegraph. The engine again moved forward, when the plows turned up the loose mud drift of Egypt, laying six furrows side-by-side, with the most perfect ease and in the most workmanlike manner. The consumption of fuel and water was very moderate.—That the engine is a complete success, there can be no doubt, and all that is now wanting, is to demonstrate that, taking the whole expense into consideration, it is cheaper than horse-power. If this is answered in the affirmative, it will produce the greatest revolution in agricultural progress that we have yet seen; it will take another wrinkle from the brow of labor, and give to the toiling millions lighter tasks to perform.

The inventor, in a recent note, says:—"I know the good people of the West are in want of my invention, as much as the people of the Old and New World were in want of FULTON'S invention. The time has come when animal power is not sufficient to perform the great work required by this class. Therefore, gentlemen, if God spares my life, it is my intention to devote my time and limited means to the speedy perfection of steam engines adapted to the cultivation of the wide extended prairies."

THE CORN CROP IN KENTUCKY.—The Louisville Journal says that the corn crop has never been so large in Kentucky as the present crop promises to be. It states that there are fields in the blue grass region estimated at one hundred and seventy-five bushels to the acre, while fields promising seventy-five to eighty bushels are quite common.

appearance of six or eight years of age. She is
t and healthy, and as active and spry as any colt.

Orchard and Garden.

PROFITS OF FRUIT CULTURE.

BELOW we give an article from one of the most experienced pear growers in Western New York. Reports from experienced growers we like to publish whether encouraging or otherwise. We want the truth, the whole truth, and shall give nothing but the truth so far as we are able to judge. Hovet's Magazine objects to some of the statements of extraordinary profits in certain cases, in President Wilson's Address, and in our own and other journals, and compares it with the mulberry and other excitements, using the following language:

"All are familiar with the oft-repeated accounts of immense profits to be realized from the successful culture of various fruits and plants. Not many years ago, the growth of the mulberry and the raising of silk-worms throughout the United States was to enrich every individual who engaged in the work; and very recently the growth of the sugar cane was to afford similar remuneration to all who raised this important agricultural product. The profits of grape culture in the West have been rated at the most extravagant sums per acre; and the culture of the raspberry for the New York market has yielded immense results. But all these and many other garden products have failed to satisfy the desire of many of those who have engaged in their culture with a view to the accumulation of a rapid fortune, and they have become quite as much, if not more, neglected than if no such fabulous statements had ever been made. It has been discovered that there was no truth whatever in these extravagant stories."

That there are instances where great results have been obtained, we do not doubt; but we do deny that they form reliable data upon which cultivators may undertake the growth of fruit with the expectation of the same profit."

Now, it does appear to us that a man must have more assurance than ordinarily falls to the lot of one human being, and certainly more than is of any advantage to anybody, to call in question statements made upon the authority of honest and careful men, without any evidence of their incorrectness, just because they do not suit his fancy. Then, we have no sympathy with the idea that supposing the statements to be correct, it is unwise to make them public, because "it is not probable that one cultivator in a hundred would obtain the same results." If a farmer raises an extraordinary crop of corn or potatoes, or a fruit grower of apples or pears, by extra good culture, we see no object in concealing the fact for fear that others may be misled by expecting a similar crop with ordinary or poor culture. We publish such statements as an encouragement, and it never once entered our head that any one would be misled by them. We have too much confidence in the good sense of the people to suppose they would expect such results without similar treatment. Our Agricultural Societies offer premiums for the largest crops, for the purpose of inciting others to strive for like results, and the officers, no doubt will be surprised to learn that instead of doing good by this course, as they had supposed, they are perpetrating mischief, as "it is not probable that one cultivator in a hundred would obtain the same results."

Mr. H. is very unfortunate in his allusion to the sugar cane. We never knew that its growth was promised "to enrich every individual who engaged in its culture." The sugar cane has met the hopes and expectations of the most sanguine, we think. But very little syrup was made in this section last year. Now, hundreds and thousands of gallons are in process of manufacture. The cane has made a splendid growth, and yields bountifully as fine a syrup as any one can desire, and the seed in most cases is fully ripe. We have watched this matter from its first introduction, and we are now almost prepared to say what we have not said before, that it is a success. The farmers of the North can make their own syrup abundantly and cheaply, and of the very best quality. We have no sympathy with humbugs in Agriculture or Horticulture—condemn all we think merit condemnation—but we must say that the greatest humbugs of all are those who cry "humbug" at every new thing without a proper examination of its merits. Men cried "humbug" at the introduction of the cast iron plow, and of reaping machines, and if the Irish potato had been introduced this year for the first time, thousands would have pronounced it a humbug.

GROWING PEARS.

ALTHOUGH much has been said about growing Dwarf Pears, and the failure and success thereof, permit me to state briefly some of my experience in relation thereto. The only trees I have in any considerable quantity, of one variety, of suitable age for bearing, consists of about 120 trees, on one-third of an acre of land, of the Duchesse De Angouleme variety, planted out seven years ago, and were then two years old. Most of the balance of my orchard, having been rebudded, is not yet in bearing. This one-third of an acre has borne pears to the value of over \$400, as sold. My first sales were at \$13 per barrel; second, \$14 for first quality, and \$10 for balance. Third, this year, when the crop is light, perhaps from the same reason that the crop of apples is light, my first quality sold for \$25 per barrel; second quality \$17; and third, consisting of pears blown off or prematurely ripened, \$12 per barrel.

I have grown beans and other crops enough on the same ground to pay the entire expense of culture during the whole time, and the culture has been the same, as near as may be, that we usually give a crop of beans or potatoes; and at no time, previous to the last year, has there been applied over four wagon loads of manure per acre in any year, and the last year about twice that quantity, which I am satisfied is well repaid in the size and quality of the fruit. My best barrel this year numbered 166 pears, averaging between 13 and 14 ounces each, and the barrel of smallest contained 314, while only one barrel contained over 241. A pear orchard of this kind, 10 by 16 feet, without any other crop on the ground, may be well cultivated at less than half the expense of a crop of corn or potatoes; for by going each way, occasionally, with a two horse cultivator, very little remains to be done to leave it a finished job of clean culture.

My trees are as vigorous and strong as any other fruit trees of same age, averaging about 12 to 15 inches in circumference at the base, and making a yearly growth of 1 1/2 to 4 feet. They are well shorted back every year; and in this respect perhaps more than in any other, consists the difference between my care of them and the care bestowed upon a large portion of the Dwarf Pear trees that have been planted during the last few years.

With a choice of varieties which experience alone can enable us to make, with certainty of greatest success, and with well grown trees on the best of stocks, I am led to believe that after the trees have been set five or six years we may grow Dwarf Pears that are worth from \$10 to \$25 per barrel at less labor and expense, and with as much certainty of a crop, as we can potatoes, that are worth from 75 cents to \$2.50 per barrel. Let those who prefer to grow potatoes or grain crops exclusively, do so, but I apprehend that many are already beginning to anticipate better results from labor otherwise directed, and I have full confidence that they are not mistaken. T. G. YOMARS, Walworth, N. Y., Oct., 1868.

ORCHARD HOUSES.

It is well known to most of our readers, we suppose, that in England, peaches, nectarines and apricots, will not ripen if the trees are grown as standards, as they are usually grown with us. To ripen these fruits they are trained on brick walls, in the form of espaliers, and are kept pruned with the nicest care. This of course requires a great deal of labor, attention, and skill. Of late years, however, houses similar to grape houses, and called orchard houses, have been erected for growing these and other fruits, and have proved very successful. The trees are kept a dwarf form, and are sometimes planted in borders and sometimes in pots.

Above we give, from the *London Gardener's Chronicle*, a pretty specimen of one of these small trees, a nectarine, as it was received, growing in an eight inch pot, by its editor, from the house of Mr. Rivens. No houses have been erected in this country for growing fruit exclusively, that we have learned, but some gentlemen have grown trees in pots in their plant and grape houses. At the exhibition of the *Genesee Valley Horticultural Society*, early in July last, one of our amateurs exhibited a magnificent dish of peaches, grown on a young tree in his grape house. Before many years, orchard houses will be as common as grape houses.

FRUIT TREES—A CURIOSITY—BANKING UP.

I HAVE an apple tree, set four or five years ago, which was completely girdled by the mice, winter before last, near the ground; nothing whatever has been done to it, but it is now alive, (Oct. 7th.) and has 18 Baldwin apples on it, of about medium size. No bark has formed on the girdled part, which is three or four inches wide, but the wood appears dry and dead at the surface. Verily that tree has pursued the path of duty and of usefulness under difficulties and discouragements, and with a zeal and perseverance worthy of the great cause in which it is engaged. Take notice, I do not advocate mice nor their industrial pursuits in general or particular. I had rather have them in the corn crib than the orchard, for this is the only tree among 40 or 50 which received their special attention that either lived or has borne fruit.

Last fall I called upon my friend Lewis E. SMITH, of Livonia, during his absence, and invited myself to a good dinner at his house. I noticed in particular the neat and proper manner in which he had banked up his young fruit trees, and I resolved that I would go home and build small pyramids round mine. I had some potatoes to dig first—some corn to husk—some fence to fix—some winter and frost—alas, poor trees, victims to a "convenient season." No; luck was on my side,—spring came and the trees were safe,—the mice had been generous,—poor SMITH had piled up his dirt for nothing—never mind it, SMITH—just do the same thing this fall, and I will bear you company, corn or no corn, potatoes or no potatoes. Only think of it,—a long winter at the mercy of the mice—instantaneous gnawers!—who for a little questionable bark, (as CARLYLE would express it) make our palates void of luscious sweets for long years to come. Trust them not; they may have a turn of amiability now and then, but take them on the average, and their tender mercy is cruelty. Let them have no grass or rubbish near the tree to make nests of—but raise a mound of clean dirt about the trunk fifteen inches high and two feet across the base.

You may think that you will tread down the snow hard around your trees and head off the enemy in that way, and you may not do it, or you may have to do it several times. Shoveling up the earth, and shoveling it down again loosens the soil and helps you in the cultivation of the trees. A man pays the insurance company liberally to guarantee the safety of his house from fire—the mice do more damage to young trees than the fire does the houses in the rural districts, you can "insure" your trees as cheap as you can your house, and in as safe a company.

Farmers have made the cultivation of fruit incidental and secondary to their other business—sure to get more on hand than they can properly attend to, their fruit and fruit trees are first to be neglected, and last to be attended to; and yet the whole world

may be challenged to show as great profit from any other branch of husbandry as from fruit growing. A square rod of ground, with a pear tree on it has been known to yield three hundred per cent. greater profit than any rod devoted to wheat, or corn, or potatoes since the world stood, and yet, forsooth, among farmers the pear tree is neglected, and forgotten almost as much as God is in fashionable churches. Do not, my brethren, add to your other sins the destruction of any trees for the want of banking up,—do that the fore part of November

R. T. A.

WINE-MAKING.

This subject is now receiving a good deal of attention. Almost every one with a little surplus of fruit, currants, raspberries, grapes, &c., is attempting to make wine. This is a very simple matter, and yet from the number of inquiries we are constantly receiving, it seems to be little understood by the people generally. The process, in brief, is to mash the fruit, press out the juice, which is placed in a cask where it will ferment, for about ten days, when it should be corked up. Grapes rich with sugar, like the Catawba, when well ripened, require no sugar, but many other sorts of grapes, and most other fruit, will not make wine without sugar, nor will any grape unless well ripened. To place information on this subject fully before our readers, we give the following very complete article, written by JOHN A. WARDEN, of Cincinnati, where wine-making is a business of importance, and originally published in *Emery's Journal of Agriculture*:

Vintage.—The gathering of the grapes should not be commenced too early, an error into which many persons are often tempted. The process of ripening continues, in the more complete softening of the pulp, and the formation of saccharine matter, after the coloring of the berries has given the appearance of maturity. Experienced vine dressers are becoming more careful to avoid hurrying the vintage too early, and find their advantage in the richer product of juice. The vintage is obtained by cutting the ripest bunches with a sharp knife, so as not to bruise nor crush the grapes; which are collected in baskets, and transported to the press house, where they may be spread out upon shelves until a sufficient quantity is obtained for a pressing. Some persons, after allowing their grapes to become perfectly ripe, spread them, when gathered, upon well ventilated bins or trays, or upon straw, where they may evaporate the excess of water; and thus the must produced from them will be richer in saccharine matter.

Sorting the grapes is necessary to the production of good wine. If, from want of care in gathering and transporting, any of the berries have been crushed, or even broken from the stems, they should be removed, unless the grapes are to be immediately put upon the press. All green or imperfectly ripened grapes should also be removed before pressing, and great care should be taken to reject any that have the bitter rot or other form of decay, as this seriously affects the future character of the wine. Some prepare the grapes for the press by stemming them, for which purpose a coarse sieve is used, upon which the bunches are placed and rubbed from side to side with a piece of board, so that the grapes are pushed through and the stems retained. It is supposed, however, that the tannin of the stems is of service to the wine.

Mashing the grapes is considered a necessary operation, even where a large press is used. When practiced, it may be performed by a beater in a deep tub, or by a mill, consisting of double rollers, which crush the grapes as they are received from a hopper, as shown in the engraving.

"Treading the wine vat" is not practiced in this country, though in some parts of Europe it is still pursued. The most perfect cleanliness should be observed in all the processes of wine making; and with this view the grapes are broken in a machine constructed for the purpose, or sometimes passed through a cider mill, when the mashed grapes are either at once put upon the press, or allowed to lie in the vat for a longer or shorter time, according to the desire of the vine dresser to produce a light or high colored wine, as the coloring matter, which is in the skin, is most effectively obtained by its maceration in the juice. Sometimes the mashed grapes are even allowed to remain in the vat until they undergo fermentation, which is called "fermenting in the skins." In addition to other properties thus acquired, the wine is rougher as well as more highly colored. The anstere wines of France and Spain are prepared in this way, and the process is allowed to go on until the froth and skins rise to the top and crack with the escape of the gases produced by fermentation, when the wine is drawn off from the lower part of the vat.

The Press, from a wooden lever, with a coffee bag full of grapes as its fulcrum, has grown to be a grand affair, and is quite an expensive piece of apparatus. A perfect iron screw of 4 inches in diameter, is the means of obtaining power. This may be used in a strong frame like that of a cider or hay press, or, still better, standing alone on the platform of heavy timbers which are firmly bedded together. The screw is surrounded by a collar of tin, to screen it from the action of the grapes that are piled upon the platform, in a framework, with straw, or are retained in place by straw alone, as the cheese is formed of apple pomace for cider making. The sides of the cheese may be cut down two or three times, and the trimmings thrown on top, upon which the strong pieces of plank

and blocks are placed to receive and equalize the action of the screw. Great power may be had with a lever applied to the follower of this screw; and by some simple contrivances this has been much increased. The pomace is reduced to a dry, flaky mass, stems and seeds, when the pressure has been well applied; and this is then called the "mare," (obscure), and may be wet and mixed with the inferior grapes, and again subjected to pressure, to make vinegar; or the mare may be allowed to ferment, preparatory to the manufacture of brandy. It is frequently thrown away, however, or returned as manure to the vines.

The must, or grape juice, is conducted from the press by conduits, when the press is over the cellar, and led into the casks for fermentation. The casks should be perfectly clean, and the practice of "stomping," or burning sulphur, is generally pursued. Paper is prepared by being dipped into the melted sulphur, and a small piece of this is burned within the cask for the purpose of fumigation. The cask may be of any size, from that of a whiskey barrel up to a Heidelberg tank; but a considerable quantity, the result of one pressing, say 300 or 400 gallons, is generally put into one cask. The common estimate is four gallons to a bushel of grapes.

Fermentation commences soon after the must has been put into the casks, unless the cellar be very cold; for these casks should always be placed in a deep cellar, so as to keep up an equable and low temperature. Good ventilation should be established, and perfect cleanliness and purity of the wine cellar are absolutely necessary. The fermentation depends, however, upon the access of air at a temperature of 50° to 60° F., which, combining with the gluten present in the juice, changing the sugar into alcohol, and in the fermenting process throws off a large amount of extraneous solid matter, so that the wine is purified and becomes "fine." There escapes at the same time, a large quantity of carbonic acid gas, the product of fermentation, and this enables us to regulate the force and rapidity of the process by an arrangement of the bung, which may be loosely put in, or left open entirely; or it may be arranged so as to conduct the process under a graduated pressure by the use of the tube bung opening under water,

which is highly esteemed for this purpose. When used, the casks are not to be filled quite full, as some air must be present. The first fermentation is generally effected in a few days or weeks, and the "wine," as it is then called, gradually settles down to a clear liquid without any addition. No sugar, nor material of any kind, should be added to the must to make good wine, as all such additions are considered adulterations; and no mixtures of grape juice with added sugar and whiskey is worthy of the name of wine.

The wine being cleared by this fermentation, may be racked off into clean casks, to separate it from the lees or settlings, and then may be transported to market for the manufacture of champagne or dry wine, as desired; but it is not yet perfect wine, as it still contains the elements of fermentation, and on the access of warm weather in the spring, will go through a second fermentation. This is supposed to be owing to the blossoming of the vines; but it is only a coincidence. The temperature at any season is the exciting cause. Until perfectly fermented, the wine should never be bottled, as the expansive force will break the glass. While in cask, the vessel should always be kept bung-full, so as to exclude the access of air; and for this purpose, at the time of racking the wine, reserve casks of small size are filled, from which smaller vessels the larger ones are supplied from time to time.

Racking is not a necessary process. Where the wine may be allowed to stand undisturbed in the cellar, it may remain on its lees. But this process is a good way of separating it from the deposit; and when the liquid is turbid, so as to require the addition of materials to "fine" it, the racking is done to separate the wine from the substances that have fallen to the bottom in clarifying it.

Fining.—In the process of transferring the liquid from one vessel to another there will be a good deal of exposure to the air, which not only allows the escape of some of its aroma, but also tends to acidulate it; and it is therefore recommended to rack as little as possible. But some wine coopers advise frequent racking, as, if wine is transported in the first cask, (without racking,) the lees are stirred up, and it grows turbid, and must be allowed time to settle, or requires to be "fined."

Fining wine consists of adding some material that will coagulate in contact with some of the elements of the liquid; and then as the coagulum subsides, the floating masses that rendered it turbid are carried to the bottom. The whites of eggs, fish glue, and other substances, are used for this purpose.

Bottling consists in transferring the wine from wood to glass; and as the latter material is brittle, the wine should never be put into bottles until it has perfectly fermented; for the escape of the gases will either spring the corks or break the bottles, and the wine in either case will be lost or damaged. The corks should be of the best quality, and should fit very tight; when out off close to the glass, they should be sealed with wax. After this, the bottles may be laid upon their sides, and placed either in the cellar or in the garret. The latter position, though a means of ripening and improving the wine, is a severe test.

Analysis.—The means possessed for judging the quality of wines are, first, a fine sense of taste and smell, well practiced in testing the particular climes of wines. We may decide upon the strength of wine by taking its specific gravity—that is, by weighing it—for which purpose a little instrument is used that shows exactly what per centage of

alcohol is present in a perfected wine. This substance being lighter than water, the mixture will be lighter, just in proportion to the amount present. The alcoholometer, used chiefly among the vine growers, is so arranged as to show also the amount of sugar present in the juice or must, which is an indication of its value or richness. The sugar adds to the weight of water; and the must is valuable in proportion to the weight it indicates when tried by the wine scale.

Sweet wines may be made to suit certain palates by adding sugar to the must before fermentation, but are considered inferior to good dry wines; and no wine grape properly ripened and well manufactured, should have any foreign admixture whatever in the preparation of good pure wine, and none other should be made.

MAPLES.—Will you please inform me through the mediumship of your valuable paper, the best time for, and mode of, planting young maples for shade trees?—J. W., Victory, Oct., 1868.

REMARKS.—Plant either in the fall or spring. Get good young trees that have not grown up crowded, or in the shade. Take them up carefully so as to injure the roots as little as possible, plant them well in a good soil, and out the tops back close. For more full directions on the subject of planting trees, see last number. Before the weather gets warm next summer, throw a bushel or two of refuse stuff over the roots, to keep the ground cool and moist, so that the young roots that have not fairly recovered from removal, may not suffer for want of moisture. If the season proves unusually dry, and any of the trees show signs of flagging, give each two or three pails of water. Do this, and not two in a hundred of your trees will die.—In answer to other inquiries we will say that, as a general rule, all trees may be transplanted from the time of the falling of the leaves until the buds start in the spring. And all seeds of trees may be sown as soon as ripe.

CROW SWEET APPLE.—"J. R.," of Hocking Port, Ohio, inquired in a late number for the *Crow Sweet Apple*. A correspondent says, "the *Crow Sweet* is an old variety in New England. It is a dark red apple, from small to medium size, usually very prolific every second year; keeps remarkably well as to time, lasting often till May, but by that time loses all its juice and flavor, being but little better than chips. It is not worthy of general cultivation, as in early winter there are many better apples, and when others are gone this is good for nothing."

Domestic Economy.

INQUIRY.—CAKES, TOMATO SAUCE, &c.

WILL some RURAL housekeeper please to give a recipe for sponge ginger cake? I send some of mine that I know to be nice.

QUICK CAKE.—Two cups of sugar; 1 of butter; 3 eggs; 1 1/2 cups of milk; 1 teaspoon of saleratus; flour enough to make a soft dough—spice.

GINGER POUND CAKE.—One cup of butter; 2 of sugar; 1 of molasses; 1 tablespoon of ginger; 1 teaspoon of saleratus; 4 eggs; 4 cups of flour. Beat until light.

DUTCH DOUGHNUTS.—One cup of cream; 2 of sugar; 3 eggs; a piece of butter, the size of a walnut; nutmeg; 1 teaspoon of saleratus—made in a soft dough.

BEST COF CAKE.—One-half cup of butter; 1 cup of cream; 2 cups of sugar; 3 of flour; the whites of 4 eggs—lemon or nutmeg.

WASHINGTON CAKE.—Take 1 1/2 pounds of sugar; the same of flour; 1/2 pound of butter; 8 eggs; 1 pint of milk; mix as for pound cake. Just as it is ready to bake, dissolve a teaspoonful of saleratus in a little sour cream—nutmeg, or essence of lemon—bake it as a pound cake.

TOMATO SAUCE.—Eight pounds of tomatoes, peeled, to 3 pounds of sugar; 1 quart of vinegar; 1 1/2 tablespoons of cinnamon or cloves. Stir it frequently, for three or more hours, until it comes to the right thickness.

LEMON CUSTARD.—One-fourth pound of butter; 1 pound sugar; 4 eggs; 4 crackers, grated; 2 lemons; 1 pint of sweet milk. The milk must be put in just as it is going to be baked.

PRESERVING CITRONS.—Pare the citron and cut it in slices half an inch thick, let it lay in salt and water for an hour, then wash the salt off and boil it in strong ginger tea; make a thin syrup and boil it again, then make a syrup of a pound of loaf sugar to a pound of citron, and boil it in this till it is clear. Season it with mace and lemon peel. Salem Co., New Jersey, 1858. X. Y. Z.

ANOTHER RECIPE FOR PRESERVING CITRON.—Having noticed in the RURAL an inquiry for the best method of preserving citrons, I send the following, which we think excellent. Peel and cut in any shape you may desire, remove the seeds, put in a preserve kettle, and cover with cold water. Boil till quite soft, then take out into a jar, being careful not to break them. Now add to the water in which the citron was boiled, three-fourths pound of coffee sugar to each pound of citron—the citron must be weighed before it is boiled. Boil till nearly as thick as molasses, taking off all the scum which rises. Add one ounce extract of lemon and half pint of good vinegar to every four pounds of citron, mix well with the syrup, but do not allow it to boil, as heat will destroy the strength of the lemon. Pour the syrup on the citron, let it stand a day or two, then pour off, and boil slowly twenty minutes, or half an hour. This must be repeated two or three times, pouring on the syrup hot each time, and you will have a sweetmeat which will please an epicure.—MARY H., Orion, Mich., 1858.

GRAHAM CAKES.—In a late RURAL, I noticed an inquiry for a recipe to make "Graham Cakes." Here is mine. To 1 quart graham flour, add 1 teaspoon salt; 5 tablespoons molasses; 2 tablespoons yeast, or a small yeast cake; stir as thick as pound cake. Let stand over night, if wanted for breakfast. When ready to bake, add a well-beaten egg and a teaspoon soda. Bake in cups, half an hour. We think they are excellent.—MISS L. B. ANDREWS, Victory Mills, Sar. Co., N. Y., 1858.

Ladies' Port-Folio.

A MOTHER'S LOVE.

BY MRS. HENRIETTA LEGGOTT.

"A MOTHER'S LOVE!" That hallowed word—
Ah! who can feel its depths?
None but a mother; for the loved,
How she has prayed and wept!
Tears vain for mortal eye to scan
The vast ethereal space;
And yet, as vain for man to strive
A mother's love to efface.

Her affections' fountain knows no change,
Its tide will have no ebb,
It still flows on when the dark grave
Enshrouds the lovely dead;
It has no semblance on the earth,
In its exhaustless tone—
It knows no change, though it may live
Without a fond return.

What are her duties? Oft that thought
Must fill her yearning breast,
While training the immortal souls
For an eternal rest;
She has the caresses that contain
The gems of parent ray—
The soul with its undying worth,
That cannot know decay.

She may increase in brilliancy
The diamond's watery hue,
And fill the youthful mind with truths,
"Distilled as early dew;"
A precious pearl, to purify,
The cross to purge away,
A gem to deck the Savior's crown
In Heaven's eternal day.

Her duties are to discipline
The ferrest hearts in love,
With ardent faith, and zealous prayer,
To guide their thoughts above.
Let holy truths on youthful minds
Indelibly be given;
That they through every change may find
Their home of rest in Heaven.

Written for Moore's Rural New-Yorker.

CLEANINGS.—NO. II.

"When he ten times as rich, I'd refuse night or day,
To change with my friend who lives over the way."

Our neighbor, Mr. B., lives "over the way," in an elegant mansion, brown stone front, marble steps, etc. We live in a two-storied white house, with wooden steps, and a very unpretending green door. When a silver plate with the name, "E. D. BONAPARTE B—," inscribed thereon, made its appearance on Mr. B.'s front door, papa's ambition immediately aspired to a door-plate—not silver, of course, but a brass one. However, I coaxed that idea out of his head, for just think how "TIMOTHY JOSUA DONNS" would look on a brass plate, attached to our green door! I have trailed some morning glories over that side of the house, and I think the blue flowers are a decided improvement—vastly superior to brass door-plates. Papa thinks so, too.

Mr. B. has a wife, and she has a tongue. I do not mention it as anything very unusual, for all women generally have tongues, but Mrs. B.'s is quite a lengthy affair, a very "unruly member." I don't think she uses it in the way God intended she should, for, in warm weather, when the doors and windows are open, the first thing you hear in the morning is Mrs. B. calling Mr. B. to an account, for doing those things which he ought not to have done, and leaving undone those things which he ought to have done.

Ah! E. D. BONAPARTE B! A sigh for you, poor, meek, little man!

Next, Master BOBBY is lectured for associating with those inferior children—the young DONNSs, who live "over the way" in the two-storied white house. Miss MATILDA ANN has her ears boxed for tearing her dress, receiving at the same time a maternal admonition, not to be caught climbing fences again, but to sit down in the house at her sewing, as all little girls should; and BOBBY is blessed with a piece of Mrs. B.'s mind, because she will persist in boiling the potatoes before they are peeled, while Mrs. B. insists that they should be peeled before they are boiled. And this is the programme of every-day performances, (Sundays not excepted.) From Mr. E. D. BONAPARTE B. to BOBBY, and then back again; BOBBY, Miss MATILDA ANN, BOBBY, and Mr. B.

Mrs. B. appears to enjoy herself. I really think she does; and Mr. B., the little man with the long nose, indulges in an unaccountable mania for visiting asylums for deaf and dumb persons.

Well, we enjoy ourselves finely in our two-storied house, notwithstanding Mrs. B. has forbidden BOBBY to associate with us. However, the young gentleman manages to steal "over the way" one or two evenings in the week, to chat with the young DONNSs. By the way, BOBBY does not resemble his mamma, in the least, being very good-looking, amiable, etc., although I do not know as that has anything to do with this article.

There, Mrs. B. has commenced again. "So you were 'over the way' last night, were you, ROBERT B.? And your father upholds you in your plebeian tastes? You don't either of you deserve to be called men!"

Well, I shut the door, with a sigh for E. D. BONAPARTE B. and BOBBY, feeling very thankful that I don't live "over the way."

Isn't there a verse something like this, in a dear, old Book?

"Better is a dinner of herbs, where love is, than a stalled ox and hatred therewith."
Rochester, N. Y., 1858. WINNIE WILLIAMS.

A CHILD'S LAUGHTER.—Is there anything like the ringing laugh of an innocent, happy child?—Can any other music so echo through the heart's inner chambers? It is sympathetic, too, beyond other melodies. When the father sits absorbed over his book, which seems to concentrate every faculty, he hears his little boy laughing in his sport, and laughs, also, he knows not wherefore.—The bright being continually gathering intelligence, casts around us gems of thought and pearls of affection, till our paths seemed paved with precious stones from heaven's treasury. No day of storm is dark where he is—no wintry evening long. A young child is a full fountain of delight to the house and heart.—Selected.

"MR. DRIVE" IN THE FAMILY.

Written for Moore's Rural New-Yorker.

MR. DRIVE was a man of considerable importance. He was independent as to property, had a good deal of business to transact, and was always in a hurry. He seldom or never spent his time in social idleness, visiting or chatting with family or friends. No, he was one of your stern, prompt, far-seeing, go-ahead, money-making men—walked up to the mark himself, and liked to see others do the same. True, he often forgot some trifling domestic errand, and was remiss in various small affairs, not worth speaking of; for who could expect a man of his stamp, to attend to trifles? However, every one in his employ soon found that the most accidental inattention to his smallest interests was not to be committed with impunity, nor tolerated for a moment. Mr. DRIVE was at home occasionally, where his will, in all things, the rule to govern the actions of each member.

Mrs. DRIVE was a quiet, inoffensive, unobtrusive body, whom no one feared, or cared to please. It was no matter what Mrs. DRIVE thought, or whether she was pleased or displeased, since, whether she was or not, she never scowled, or frowned, or scolded, or pouted, in order to gain her point.—She gave directions calmly, quietly, and went about her own business in the same manner, making up by attention for the neglect or carelessness of others, in every way she could—and that did not prove to be a wise plan, for what did the heedless care how much she did? Did her example shame their remissness? But when Mr. DRIVE gave orders so and so, in his peremptory tone, nimble hands and feet obeyed, as a matter of course. And so Mr. DRIVE was the oracle. Perhaps an example of his summary method, will explain things a little clearer.

Mr. DRIVE took his customary bath, Mrs. D. having previously prepared towels, &c., and placed changes of garments, meanwhile going to the sitting-room to read. Presently, Mr. DRIVE came in—a thunder cloud in every line of his face—and seated himself before the fire without a word. Mrs. D. looked up casually from her paper—saw there was difficulty somewhere, but not divining the cause continued her reading. At length, remembering that he had finished his bath, she noticed that he had not changed his shirt, and asked if he had found his drawers, and put them on?

"I put on all that were fit—the same ones I had on!"

"What is the matter of the others?"

"No buttons on them, and haven't been this summer! No buttons on any of my clothes, half of the time! I'll get you another girl, Mrs. DRIVE, and see if you can sew on my buttons! Probably you have 'nt time now!"

Mrs. D. kept two girls, and had a very small family, and had time to do all her sewing, though her health was never very good, or permanent.—She meant to be prompt in every duty, but occasionally a button would be gone—not ripped off, but broken in the washing some way,—and garments would be put away without her knowledge that they needed some attention. Mrs. DRIVE went immediately and sewed on the missing button, and inquired what others he referred to?

"Well, one of his shirts he had brought home, without a button on the neck, he believed," Mrs. D. could not find any gone, however, and the matter apparently dropped. But you should have heard and seen his tone and manner—stern, loud, sharp—the one he always used to delinquents, his wife not excepted. Mrs. DRIVE was accustomed to it now, after years of vain efforts to please him, and tears wasted because of failure. But she could not help thinking how willingly and gladly she would have sewed on the button if he had only asked her pleasantly and kindly. QUEECHY.

PURITY OF CHARACTER.

OVER the beauty of the plum and the apricot, there grows a bloom and beauty more exquisite than the fruit itself—a soft, delicate blush that overspreads its blushing cheek. Now if you strike your hand over that, and it is once gone, it is gone forever, for it never grows but once. The flower that hangs in the morning, impregnated with dew—arrayed as no queenly woman ever was arrayed with jewels,—once shake it, so that the beads roll off, and you may sprinkle water over it as you please, yet it can never be made again what it was when the dew fell silently upon it from heaven! On a frosty morning, you may see the panes of glass covered with landscapes—mountains, lakes, trees, blended in a beautiful, fantastic picture.—Now lay your hand upon the glass, and by the scratch of your finger, or by the warmth of your palm, all the delicate tracery will be obliterated. So there is in youth a beauty and purity of character, which, when once touched and defiled, can never be restored; a fringe more delicate than frost-work, and which, when torn and broken, will never be re-embroidered. A man who has spotted and soiled his garments in youth, though he may seek to make them white again, can never wholly do it, even were he to wash them with his tears. When a young man leaves his father's house, with the blessing of his mother's tears still wet upon his forehead, if he once lose that early purity of character, it is a loss that he can never make whole again. Such is the consequence of crime. Its effects cannot be eradicated; it can only be forgiven.—Henry Ward Beecher.

BLESSEDNESS IN SORROW.—There are times when some great sorrow has torn the mind away from its familiar supports and laid level those defenses which in prosperity seemed so stable—when the most rooted convictions of the reason seem rottenness, and the blossom of our heavenward imagination goes up before that blast as dust—when our works, and joys, and hopes, with all their multitude, and pomp, and glory, seem to go down together into the pit, and the soul is left as a garden that hath no water, and as a wandering bird cast out of the nest—in that day of trouble, and of treading down, and perplexity, the noise of voices, the mirth of the tabret, and the joy of the harp, are silent in the grave. Blessed is the man who, when cast into this utter wretchedness, far away from all creatures and from all comfort, can yet be willing, amid all his tears and his anguish, there to remain as long as God shall please.—British Quarterly.

That is not wit which consists not with wisdom.

Choice Miscellany.

AUTUMN THOUGHTS.

CAN I not check thee, ruthless wind,
Nor stay thy hand, whose chilly grasp
Plucks off the red and golden flash
That seemed the fairest, not the last—
Nature had wrapped it round and round
In regal folds of leafy green,
'Till the whole Forest was enrolled
In a rich web of changing sheen.

But see! the sunshine hides her smile,
The blast comes roughly 'round the hill,
He scatters shivering leaflets far,
Nor heeds the rain, she weeps so still.
So beautiful our Forest seemed
Beneath October's calm blue sky,
We never thought of Change or Death,
'Till raindrops sobbed a last good-bye.

Ah! then we tho't, with saddened heart,
This is the way of all the Earth,
Change stands behind, and calls her own
Our fairest hopes are they have birth;
Yet we may cling to one bright truth,
'Tis sweet as light of even,
We'll fold it to our heart again—
Change entereth not in Heaven.

THE DREAMER.—No. IV.

WITHERED FLOWERS.

CONVALESCENCE is pleasant, but cannot always last; neither can it be profitable. By the way, what a pity it is that so many pleasant things should be so unprofitable—novel-reading, smoking, dreaming, for instance. In spite, then, of my lazy half-wish to keep sick, I do get well at last. By slow degrees strength comes back, hesitatingly, like some long estranged one, wishing to resume our friendship, but feeling injured, and not liking to be too easily regained. We never really appreciate our friends until we have been deprived of them, for a time, by some quarrel. Then we know how strong our affection. So, when we have been sick, we confess with much sorrow that we have injured our friend, Health, very much—we ought to be more thoughtful—if she will only stay by us, and trust us once more, we will be more careful of her welfare. And then she comes back to us, and we welcome her, and are very chary of her for a little while, and again grieve her, just as before, and by-and-by she leaves us altogether, having no more faith in us, and Death takes us, and we cannot cheat or abuse him.

But I am well at last, and I leave my kind friends and make my way to the city again. Sisy bids me farewell at the door—just where her welcome was given a short time ago. She looks, if possible, kinder than when I entered there. If you wish to make persons friendly to you, let them do you a kindness. They will always remember that. They may forget what you do for them, but they will always bear in mind the favors they do you. They seem to have an interest in you, thereafter, to just the amount of those favors. Kindness grows much by exercise.

Tom accompanies me to the cars. I find a seat, return his hearty farewell and kind wishes, and settle back for a ride. A jerk and an shriek, and we are off—a flitting panorama of trees, and houses, and people—another shriek, another jerk, and we are there.

How strange the filled streets look. No broad, cool roads—no bright trees, and grateful shade—no flocks—no herds—and, above all, no friendly, hearty welcome. It always seems as if you could feel friendship and welcome in the very atmosphere of the country; but you never can in the city. There it is all of self-interest. "All baggage at the owner's risk," seems stamped on everything, and everybody—from children to grey hairs, everything is baggage. Money, friends, life, feelings, and all are, like toes and trunks, to be cared for by the owner alone. Talk about Solitude! Cowper, in his "vast wilderness," would be in a large company compared to any man in the crowded street of a large city. In the wilderness, he could have authors living and dead, the birds, the trees, and himself. In the city he would have neither of these—not even himself.

But I make my way to my office, and with JOHN'S help set at work to repair the damage which my long delay has caused to my business. JOHN is a good fellow. He is honest, and capable, and faithful. He looks happy now, even when delving into the hidden perplexities of business. JOHN'S SUEV must have been good and kind to him, I think. She must possess a good heart and a refined mind. Do you inquire how I know? JOHN is always kind and obliging, and hence, polite and refined. When I see him put on a kind smile to do a favor for an old man, or carefully pick up the old apple-woman on the corner, I think, "that is to your mother's credit." And when I see him deferential and dignified, as well as kind and polite, to the young ladies, I think, "that for SUEV"—for JOHN tells me he has no sister. By these things, I know SUEV to be both kind and refined; for, if she were otherwise, JOHN would be like her. No one has so much influence on a young man as the one he has chosen to wrap in all the excellencies his mind can conceive.

How dreary it seems when I go back to my boarding place—my home. How I long for the quiet retreat of H— Farm, and wish I could have one just the same—that I could have had a Farm and a SUEV to make me a home. But it could not be so, and I acquiesce as best I may where I can—not alter.

Some people speak of a "Grave in the Heart," and of buried affections, dead love—I don't believe in it. Our affections never die. I may have loved SUEV, and another may have won her, but my love is not dead. There is no grave in my heart. I need not close my breast to all human sympathy and love for that one disappointment. No, it seems more to me as if I had in my heart a little drawer, just as I have in my desk. I put my love in the former, and I put the flowers, which I have received for memory's sake, in the latter. They are sacred to all eyes but mine. I take them out sometimes, and smell their fragrance, and the perfume brings back the time when they were fresh, with sweet remembrances of the friends who gave

them. So does the incense from this drawer in my heart bring back the old times and the old hopes, and I draw a chair up beside mine, and the loved one seems to sit in it,—the dreams of youth are realities, and I revel in the happiness of my home. I close the drawer and am back in my lonely chamber.

With a smile at the Past, a sigh for the Present, and a yawn in the face of the Future, I seek sleep. Farewell!

CHURNDASHER TO PLOWHANDLE.

MISTER EDDYTUS—I thout as how there wood-ent bee eny moore harm in mi rytin tu yu, then eny boddie, soe I rekun I shall try it. Yu ce, I horn a feller snot long agow, as how hede gvy 10 dollars tu no hoo Misses CHURNDASHER and Mister PLOWHANDLE was, and I coodent help laphin tu miselph, caws yu ce, I no hur, as well as mi old spellin book! Yu ce—twyxt yu and me,—ahese noeboddy but mi cuzzin, and I donte expekt yude ever mystrust shede ever ryt a word in hur liphe, and I laphd tu, caws I new she didnt lvy a grate wasse from bym. Housever, what I want to no is, iph yude tel mea hoo Mister PLOWHANDLE is? I hera as how hese like tu bee sot up kunysdurabul bye his rytin. I wonder iph hele ryte agyn about the phare? I wish hede ben tu our phare. I want on the kunyity this yere, but iph I had ben, Ide opherd premynus on sum things noeboddy else ever dyd—thats so. I hante got time tu tell yu what nou. Nur I dydent goe nuther, caws the dorned graswhopers etc up evry grene thing I rased, and I want goen without nothen tu gyt the prymion. Wall, kant ryte no moore now, caws I've got tu dig owr putaters, and I kant bare tu, the ante wuth digen. I wish all the graswhopers'd ben droundyd in the black ce, with the rest oph the fylistins!—good by.

from yure phrend tyl Deth.

KESTAR CHURNDASHER.

P. S.—I forgot tu tel yu I lvy out here in Swamp-ton, klus tu the laik. X. O. Sept. 28th

THE GARDEN.

THE garden is a bound volume of agricultural life written in poetry. In it the farmer and his family set the great industries of the plow, spade, and hoe in rhyme. Every flower or fruit-bearing tree is a green syllable after the graceful type and curse of Eden. Every bed of flowers is an acrostic to Nature, written in the illustrated capitals of her own alphabet. Every bed of beets, celery, or savory roots or bulbs, is a page of blank verse, full of the belles lettres of agriculture. The farmer may be seen in his garden. It contains the synopsis of his character in letters that may be read across the road. The barometer hung by his door will indicate certain facts about the weather, but the garden, lying on the sunny side of the house, will mark, with greater precision, the degree of mind heart culture which he has reached. It will embody and reflect his tastes, the bent and bias of his perceptions of grace and beauty. In it he holds up the mirror of his inner life to all who pass; and, with an observant eye, they may see all the features of his intellectual being in it. In that choice rood of earth he records his progress in mental cultivation and professional experience.—In it he marks, by some intelligent sign, his scientific and successful economies in the corn field.—In it you may see the germs of his reading, and can almost tell the number and nature of his books. In it he will reproduce the seed-thoughts he has culled from the printed pages of his library. In it he will post an answer to the question whether he has any taste for reading at all. Many a nominal farmer's house has been passed by the book agent without a call, because he saw a blunt, brut negative to the question in the garden or yard.—Elihu Burritt.

UNWRITTEN SONGS.

ANYWHERE by some fringed stream in New York woods, or under the shadow of a New England mountain, or even here away in the leafy edges of Indiana or Michigan. But he must needs to get up before breakfast; it is the nature he must have performed in that hour of gold, silver and pearl, between the dawn and the sunrise. The blue-bird and the robin, the bobolink and the thrush; the mocking-bird, the martin and the sparrow, all these, and "ever so many more," fill the morning and the heart with melody. But with the first flash of sun, the ecstasy subsides, and the grand anthem is ended.

Very few, we imagine, have ever heard this gush of song. Duty may rouse them, or pain forbid sleep, but they were not charmed awake. There is a startling beauty in that concert; the listener cannot be done wondering at the volume of sweet sound there is in a single grove; the variety of the tones, and the marvellous harmony of the whole.

Beginning gradually with a warble in the grass or a note in the trees, it rapidly multiplies and deepens and extends, until every leafy bough conceals a singer, while the east is slowly brightening. With the first deep crimson and golden glow, the enthusiasm culminates, and the swelling wave of song subsides. And when the lazy World and his wife yawn their way to breakfast, they pause at the window, and while the robin holds on in its sweet old story, and the sparrow chirps a solo, they say, "how charmingly the birds do sing!" not dreaming, luxurious souls, that the concert was all over before their last dream began.—B. F. Taylor.

THE indifference with which all Americans regard the passage of a funeral procession is proverbial. Now the French people, from a regard to the feelings of mourners, as well as respect for the memory of the dead, when they meet a funeral procession, stand still, and uncover their head in the street while the procession passes. A most touching tribute to the memory of the dead. We most earnestly wish our people had the heart to imitate it.

In most quarrels there is a fault on both sides.—A quarrel may be compared to a spark, which cannot be produced without a flint as well as a steel, either of them may hammer on wood forever, and no fire will follow.—Bacon.

Sabbath Musings.

"AT EVENING TIME IT SHALL BE LIGHT."

LIGHT at the evening time!
Oh! blessed hope, when, on the waters dark,
Faith's straining eye can scarce discern the ark,
And the poor dove, in weary flight around,
No olive branch has found!

Light at the evening time!
Oh! blessed hope, when brightest suns have set
In strange eclipse while it was noonday yet,
And we remain in chill and silent fear
Within the shadow drear!

Light at the evening time!
Oh! precious promise, lightening the gloom,
When a sad nation stands around the tomb
Where Genius sleeps, and dearest hopes are laid
Low in death's awful shade!

Light at the evening time!
Oh! cheering thought, when Thy mysterious ways
Leave us, O Father, in the strange amaze
Where faith can only anchor on that word,
"So hast Thou willed, good Lord!"

Light at the evening time!
Yea, suddenly and dense the thunder cloud
May wrap the skies of noon in deepest shroud,
But the sun is not quenched—a golden ray
Shall come ere close of day.

Light at the evening time!
O, God of love! no darkness dwells with Thee,
And in Thy light at last we light shall see;
Thy covenant of mercy faithless never,
Thine own are Thine forever!

Light at the evening time!
Let us walk patiently through darkness on,
Till we arrive where clouds and storms are gone,
And all Eternity's disclosures tell
Thou hast done all things well!

Written for Moore's Rural New-Yorker.

DOING GOOD.

THAT doing good should be the great object of our lives, all, I trust, will be willing to admit, but many I fear have yet to learn its true philosophy. A life of practical goodness alone will demonstrate it, and those who live for self only, if such there be, have yet to learn the advantages accruing from such a life. The Philanthropist, who bends the noblest energies of his soul in seeking out the sorrowed and oppressed of earth—who strives to alleviate sorrow, by pouring in the balm of consolation upon the heart, or by supplying the demands of suffering humanity—feels a satisfaction within, a consciousness that he has fulfilled in part the object of his creation. The Christian who spends a life of self-denial—who labors to secure the happiness of perishing souls, by leading them to the river of eternal life, "whose streams make glad the city of our God," knows "that with such sacrifices God is well pleased." The poor Widow, as she casts her last mite into the treasury of the Lord, feels of a truth that it "is more blessed to give than to receive." So, we see that doing good is not only attended with unalloyed pleasure to us, but it is carrying out, in part, the great principles taught us by our SAVIOR, who went about continually doing good.

There are many ways by which good may be accomplished. It may not be necessary to sacrifice our possessions, our enjoyment, or our lives; but by gentle words, and little acts of kindness, we may disseminate an influence the most salutary—we may throw a talisman around the hearts of some who could not be met under other circumstances, however auspicious their character. To accomplish this, our lives must be circumspect, our characters unblemished, and our hearts adorned with love and purity. Changed, indeed, would be the aspect of earth, if all hearts were engaged in such an enterprise—how conducive it would be to our present enjoyment, and the endless felicity of the world to come.

Marion, N. Y., 1858.

ANNIE P. R.

"IS THAT ALSO THINE?"—A beautiful reply is recorded of a Dalecarlian peasant, whose master was displaying to him the grandeur of his estates. Farms, houses and forests were pointed out in succession on every hand, as the property of the rich proprietor, who summed up finally by saying:—"In short, all that you see in every direction, belongs to me." The poor man looked thoughtfully for a moment, then pointing up to Heaven, solemnly replied,—"And is that also thine?"

And is not this a question which may well be addressed to every one who is rejoicing in the multitude of his riches; who, as he looks around him sees the mercuries that have been poured into his lap; may he not be asked—"Is Heaven also thine?" And if such a question may be asked of the rich, may it not be asked of all, whether rich or poor? And may we in all sincerity ask the reader to weigh well the words—"Is Heaven also thine?"

MARAH AND ELIM.—Marah and Elim! How near they lie to each other! Thus near to each other are the bitter and the sweet of life, the sorrow and the joy of time. Both in the same desert, and oftentimes following each other in the progress of one day or hour. The bitter, too, is first, and then the sweet. Not first Elim and then Marah; but Marah first, and then Elim; the cloud, then the sunshine; first the weariness, then the rest. In token of this we broke off a branch of palm from one of these Elim trees, and laying it on a similar branch which we had brought from Marah, we tied them together, to be kept in perpetual memory, not merely of the scenes but of the truth which they so vividly teach.—Dr. Bonar's "Desert of Sinai."

DEATH WITHOUT CHRIST.—You may think to live very well without Christ, but you cannot afford to die without him. You may stand very securely at present, but death will shake your confidence. Your tree may be fair now, but when the wind comes, if it has not its roots in the Rock of Ages, down it must come. You may think your worldly pleasures good, but they will then turn bitter as wormwood in your taste; worse than gall shall be the daintiest of drinks when you shall come to the bottom of the bowl.—Spurgeon.

CHRIST is the great object of attraction to heaven and earth; the Father loves him, angels adore him and saints place their confidence in him.

The Traveler.

Written for Moore's Rural New-Yorker

Sketches from the Alps to the Adriatic.

NUMBER SIX.

The Pass of Brenner—Descent towards Italy—Sudden Change of Climate—The Valley of the Adige—Meran—Castle Tyrol—A Tramp in the Passes of the Valley—An Eccentric Companion.

THE BRENNER POSTHOUSE, on the highest point of the pass, is four thousand three hundred and seventy-five feet above the level of the sea. The road is one of the easiest and oldest across the Alps. It was used and fortified by the Romans, and the hosts of barbarians from the North, who overwhelmed ancient Rome, passed into Italy over Brenner. The pass is a narrow gorge. On either hand rise lofty peaks, their bases covered with patches of fir forest, intermingled with green pastures, but the extreme summits are sterile rock, half covered by the snow. Straight down the precipitous side of one peak, flows a torrent which draws its floods from the lowest snow banks, and dashes them over the rough rocks, till they rival the whiteness of their sources. It pours them through the forests, where they glitter among the green trees, and finally it drops their smoke-like wreath, faintly as it seems, over a high precipice, to the bottom of the gorge. There they turn the wheel of a saw mill, and then rush on through a channel worn three or four feet deep, in a direct line to the opposite peak, but turn to the right after going a short distance. If that torrent should be checked for a time, and that channel filled smoothly to the brim, and then the waters let loose again, you could not tell whether the inclination of the land would lead them to the right or left. If they turned to the left they would flow to the Inn, the Danube, and the Black Sea, but as they go to the right they find their way to the Adige and the Adriatic.

The descent towards Italy is much steeper than towards Germany. All the way to Brizen, which is twenty-five miles distant, the road passes through a gorge—the valley of the Eisack. At Brizen, where the valley of the Puster enters the valley of the Eisack, there is a strong fortress that completely commands the road. There is some level bottom land, at the latter place, on each side of the river, but the valley rapidly narrows to a gorge again as it proceeds towards Bozen, twenty-five miles farther down. In many places there is but just room enough for the boiling river, and the road is cut in the rock, with an overhanging precipice hundreds of feet high on one side and a railing of wood on the other. The river Eisack which, at its commencement on Brenner, I could easily leap across, grows rapidly larger, and at Bozen, fifty miles from its source, is nearly as wide as the Adige which it joins. I saw on the route many large wheels, turned slowly by the current, raising water to irrigate the land.

The sudden change in climate which one observes, when passing from the Northern to the Southern declivities of the Alps, is remarkable. At the time I was in the valley of the Inn, summer had not asserted there the full supremacy of her way. The earliest cherries were like green peas, and the Indian corn had but just burst forth to the sunshine—the grass, and the barley, and the rye, waved headless in the breeze—the trees had not soiled their fresh garments of joyous green—and no shepherd had dared to pipe his obedient flocks to the high pastures on the mountains. Half a day's walk direct from Innsbruck brings one to the summit of the pass, and from thence to Bozen, the distance is fifty miles. When I arrived at Brizen, I saw, for the first time, vineyards in the Tyrol. At Bozen the hay harvest had commenced several days previously, the barley and the rye were growing yellow for the reaper, the cherry trees were red with ripe fruit, the air was warm at sunset, yet pure and invigorating—the balminess of Italy mixed with the purity of the mountains. Orange, lemon, chestnut, and fig trees, stood on the slopes, and vineyards covered the broad valley below.

I went up the valley of the Adige to Meran, which is twenty-four miles from Bozen. The slopes that rise upwards from this valley are very beautiful, they are green with forests and meadows, and many villages and castles are scattered over them. I stood in one place and counted six castles. At the "Post," in Meran, I made the acquaintance of a young German who was my companion in two excursions. One was to the castle Tyrol, which, anciently, was the seat of its princes, and has given its name to the country. Three hundred years ago, a rain storm took place among the mountains and the clouds sent down so powerful a torrent of water, that it washed a deep gully close to the castle, and bore away some of the walls. The view from the ruin, over the valley and on to the mountains, amply rewards the exertion of an hour's walk from Meran. Our other excursion was up the valley of the Passes, to the house that was occupied by ANDREW BOZEN. We started in the middle of the forenoon and returned at eleven o'clock at night. The valley itself is not very interesting, as it is narrow and the mountains rather monotonous. The only road is a foot path which crosses the Passes several times, by wooden bridges. Horn's house, which is now, as formerly, an inn, stands close to the river's brink, and is larger, and better built than the majority of peasant houses. Behind the house is a small patch of tillable land, above which rise the mountain precipices and pastures. Before the door hung several targets, full of bullet holes, of which many were in the center. I was told that nearly every Sunday the peasants assemble, and shoot at targets with their rifles.

We returned in the evening, and had a pleasant walk. I shall not forget how the full moon rose over the mountains, lighting up their rocky, mowy peaks, and chasing the shadows out of the valleys. The sky looked so warm and beautiful, the air was so pure and balmy, and scented by new mown hay. As we neared Meran, we found the most of the path wholly under water, but by springing from stone to stone, we avoided wet feet. This overflow of water was caused by the opening of dams in the fields above, where the water that came down the mountains in small rivulets had been gathered for the purpose of irrigation.

My German friend was rather eccentric in some

of his notions. He did all by rule, always stopping to consider what effect a movement would have on his health before he executed it. He very much regretted that he had not brought along three clean shirts, and said that when he ascended one of the mountains near Meran, a trip of a few hours, he had carried half a dozen, all of which he used to keep himself dry. At the inn where we dined he took off his shirt, had it washed, dried, and ironed while we waited, and then declared himself ready to return.

The romantic environs of Meran, and its agreeable and healthy climate, make it an excellent place for passing a few summer and fall months. There are two well conducted and convenient hotels, which, in the time of the grape harvest, are often filled with strangers, consisting of invalids that resort thither for the benefit of the grapes, and persons seeking for pleasure. At the time I was there, a couple of English families had already been quartered some weeks at the hotel. The land in the valley is not remarkably rich, but the Southern climate together with the advantages of irrigation, render it easy to grow two crops on the land at the same time. The vines are trained over high arbors, extending from one side of the field to the other, and completely shut out the sun's rays from the surface of the ground, but beneath these vines corn, potatoes, wheat, barley, and rye grow and produce abundantly. It looked cool to see men lazily hoeing the corn in the shade under these arbors.

LINGERINGS WITH NATURE.—NO. I.

SENECA LAKE.

NOT celebrated in story—not named in song, save through PARCIVAL'S gentle notes, it yet reflects the blue summer sky and paints the living green of its banks upon the hearts of all who bask in its warm splendor, or catch its first bright spring smile. A dream of rural quiet and sylvan shades comes floating with the morning mists as they sweep down with the wind and rise to reveal the green slopes of the adjoining grove-dotted landscape. Pleasant thoughts of the valleys beyond, of the glees and hill-sides, where the vines and flowers nestle and flourish, come with the glad sunshine, as it lies afloat the distant hill-top, or glows upon the barnished water. Like thwarted human hope the winding shores of the lake show the gentle but powerful surging, the sweep of the tempest and the unnoted washing of the waves; yet, like that same unconquerable hope, it turns not from its general course, but with steady force bears onward to its destination. At the head of the lake, after a glance at its dark waters, we turn to "Glen Maria"—a rocky defile—the mark of some sudden convulsion in nature, leaving a soul-like eye in the rock-bound face thus opportunely revealed to our view. Like its slippery paths and tortuous ways are those of the sin-guided soul, ever tramping upon the narrow ledges and scaling the doubtful precipices from which a single mis-step might hurl to certain ruin.

Damp, dark, wonderful and wild—the slaty rock worn into narrow crevices and channels—the scrubby evergreens fastened to the rocky sides and the tall trees leaning to meet above—all bring a strange, weird feeling of awe and rapture, wonder and reverence. Following the winding shores of the Seneca, and pausing a moment to gaze at the Painted Rock of Indian warfare we come suddenly upon the long, foaming line of whitened waters known as Hector Falls. Leaping down between its green banks, revealing the dark line of the bridge mid way, and rivaling in whiteness the adjacent cottages, it seems an abiding life, a living picture. Miles beyond a series of garden fields and fragrant orchards, the wild glen, Rock Stream, or the "Fall of the Silver Thread," but shows its grim portal ere the majestic volume of Big Spring Fall defends our ears and enwraps our souls in new visions of awe and delight. Tumbling, roaring and bounding, it angrily rushes down the jutting rocks, to check its fury against the calm surface of the silver lake, burying and deadening its seeming wrath as the waters meet. The holder hills vanish as we sail onward past the many picturesque points and rough wharfs; the sloping hill-sides are dotted with villages—the rich meadows waving with grain and ripe with plenty. We finally land at Geneva; beautiful beyond description, yet wanting the dim vision of cloud-capped mountains, or rosetinted and fire-lifted peaks, as they lie against the clear sky, to bring a memory of Switzerland and the Alps. Still, its wondrous summer beauty lies upon many a heart, and inspires many torpid souls with holy thoughts and heaven-born purposes, which loftier hills and sunnier skies may never have awakened.

Beautiful Seneca! of life a fitting type,—changing, yet ever the same—smiling with the sun and frowning with the clouds—continually wasting, yet ever imperishable!

North Fairfield, Ohio, 1858.

L. A. T.

THE RHINE.

A CORRESPONDENT of the St. Louis Democrat describes the Rhine thus:—"Every letter writer is so full of praise of the Rhine, or its wonderful scenery, that I shall pass it all by with one or two brief remarks. In width, current, and general appearance, it resembles the Ohio at a good stage of water. It is of a beautiful light green, different from the waters of any western river I have ever seen. The current is quite rapid, but not so rapid as the Mississippi. Little, low pressure steamers, like those on the Thames, of from 80 to 150 tons burthen, are constantly passing up and down for passengers and towing barges; but none of these steamers are as fine or as comfortable as those of our western boats. They have no staterooms or cabins on the upper decks. There are, all along the river, on both sides, sloping hills, which often rise into mountains, with here and there a ruined castle on the summit, but though these slopes are often cultivated with vines almost to the very top, there is nothing in all this scenery which is equal in sublimity to the Hudson, or in beauty and variety to our own Mississippi above Prairie du Chien."

The prosperity of man lies in this one word—Education. Convey humanity to this fountain of happiness, and you bestow everything; all means of power and greatness.

THE LEANING TOWER OF PISA.

In Pisa, a walled city of Tuscany, is the famous Campanile, or Leaning Tower. This tower is one hundred and seventy-eight feet in height, fifty feet in diameter, the uppermost story over-hanging the base about fifteen feet. The material used in construction is marble—the design, eight rows of pillars, one above the other. In reference to its history and its architect, the *Cyclopedia Americana* very briefly informs us, that it was "built in the twelfth century, by a German of the name of WILLIAM."

It is a matter of doubt whether this beautiful piece of architecture has actually sunk, or whether it was designedly built with its present inclination. However, we have in the Leaning Tower a remarkable illustration of the principle, that the line of direction must fall within the base upon which the body stands for support—if it falls outside of the base, the body overturns. A line cast from the summit of the Tower to the ground, and passing through the centre of gravity, falls within the base, and it stands secure. Were an attempt made to build the Tower a few feet higher, so that a perpendicular line, passing through the centre of gravity, would fall beyond the base, it would topple to destruction in an instant. This fact demonstrates another philosophical proposition, viz:—"The larger the base of a body, and the nearer its principal mass is to the base, the more firmly it will stand."

OUR SUMMER FRIENDS.

Who is not bothered with flies in summer? Who, at this present season, has not been tempted to differ from the benevolent humorist's opinion, that the world is wide enough for him and the winged tormentors? Yet, what a profound knowledge of the animal structure can be obtained from the flies that pester us while we sit in our rooms! A work has just been published by two gifted men on the common house-fly and the earth-worm, with microscopic illustrations. In this volume attention is called to the wonderful organization of the fly, enabling it to walk on the ceiling with its feet upwards, or on the smooth panes of glass, setting apparently the laws of gravitation at defiance. Its feet, in fact, are furnished with countless minute suckers, that operate in the same manner as the leather suckers used by school boys to lift heavy stones. Then look at the neatness of the fly; how indefatigably it brushes its wings, and rubs its legs against each other, to remove any particles of dust! Those diminutive legs are covered with hairs that serve as dusts.

A scientific gentleman observed the other day in our hearing that the common horse-fly stood midway among living creatures in point of size; that is, taking the elephant as the largest among animals, and the mite as the smallest, there were as many classes of creatures smaller as there were larger than the fly. Not only its wonderful little frame, but its nervous system, is an interesting subject for discussion. As to its habit, it has a marvellous fancy for human companionship. It visits us familiarly, partakes our food, and cultivates, as far as it can, a friendly familiarity with us. Without hesitation it will alight on our faces and hands, and examine everything we do. It is among insects what the dog is among animals. Now, before we spurn the smaller intruder as an unwelcome guest, let us see if it can teach us no lesson of admiration and wonder at the Creator's power.—Viewed in this light, we shall find these summer friends capable of affording us the opportunity for much learning and profitable thought.

MICROSCOPIC WONDERS.

AMONG the most remarkable of those myriads of animals which exist in every drop of water, is the navicula—a little creature which has some twenty or thirty legs, and is endowed by Nature with an armor of flint. In a paper which was recently laid before one of the scientific societies of London, some curious facts concerning this diminutive animal were stated. Among other things it was mentioned that if an observer watches narrowly for five or six hours, he will note a thin transparent line spreading across it in some direction. After the line makes its first appearance it becomes every moment more distinct, and rapidly increases in width. At length the creature begins wriggling its limbs violently, the body splits asunder, and two new naviculae are made out of one old one. The animal has something like a hundred stomachs, and its mouth, which is situated near one extremity, is surrounded by a number of almost invisible tentacles, with which it grasps its food; but as soon as the transparent line appears, which denotes its approaching division into two, as another month will be wanted another is seen sprouting from the other extremity, and is ready to perform its functions as soon as the separation is effected. The navicula divides itself in two, once in twelve hours, under ordinary circumstances. But there are some kinds of naviculae which split themselves into sixteen instead of two in the same space of time. Were there no checks to the increase, a single one of the tribe would become the producer of many hundred millions of creatures in a month.—*Portfolio*.

THE "RURAL" IN THE FAMILY.

THE RURAL NEW-YORKER is a readable weekly, highly esteemed by ladies and children. Our better half thinks it the best of the exchanges. We shall look after this paper sharply, for if it advocates feminine agriculture, or the right of woman to dig potatoes, as we suspect, we will throw ourselves into the breach (perhaps we ought to say breeches) at every hazard. "Give us liberty, or give us death."—*Springfield (Mass.) Rep.*

THE above notice, from a "readable weekly"—on political, literary and local New England topics—is highly complimentary, though perchance intended to be ironical. Any journal which is "highly esteemed by ladies and children" must be a welcome visitor, and wield great influence at and in the Family Circle. We often receive letters which say that of the six, twelve, or more papers taken in the family, the RURAL is the most anxiously looked for each week, and the first sought and soonest and most read of the whole collection. This proves that the RURAL is appreciated by those for whose benefit it is designed, and to promote whose welfare we devote earnest and continuous labor—the various members of the Family. Our talk is not exclusively of cattle, pigs and chickens—of plowing, planting, harvesting, and selling wheat, corn, potatoes, &c.; but we believe that while these are properly discussed, it is also our duty, as it is our pleasure, to discourse of many other subjects of interest to fathers and mothers, sons and daughters, and that in so doing we increase the knowledge, pleasure, contentment, and consequent happiness of tens of thousands of people who, we trust, occupy the only foretaste of heaven on earth—peaceful and happy Homes. As to the RURAL's "advocating feminine agriculture, or the rights of women to dig potatoes," &c., we assure our contemporary that it does not believe such things heretical. Moreover, it holds that, while the men have their reapers, threshers, and other labor-saving implements, the women are entitled to similar "aid and comfort" in their department—such as sewing machines, and the various improvements for lessening the labors of the dairy, kitchen, &c. While our friend goes for "liberty or death,"—and, like many other unthinking mortals, wants all the liberty on the masculine side—we think the wives, mothers, sisters and daughters of the "rural districts" are entitled to a little more liberty, and less of the slavery which insures premature death, mental and physical.

It would of course be much easier and cheaper to make the RURAL an Agricultural—for papers which are devoted mainly to one subject, (whether Agriculture, Religion, Politics, Literature, or News), require far less labor and expense than one combining several important topics—but we shall continue to furnish one which, while it is reliable on Practical and Useful Subjects, shall also comprise such instruction, entertainment, and counsels relative to mental and moral training as we believe adapted to the wants and welfare of almost every family in the country.

—Since the above was written, our attention has been called to the following article from the last number of the *Chicago Journal*. It is so much to the point, and so handsomely endorses our notions and practice, that we cannot refrain from giving it in this connection:

"No paper in the land, whose talk is of garden, orchard and farm, is more welcome in the household than MOORE'S RURAL NEW-YORKER. It has a healthy, pleasant look, and is conducted 'excellent well.' Some agricultural editors seem to think they are writing for the pigs and the poultry instead of the people, and fancy they must 'hang about' the barn-yard, go wading in the new plowing over the top of their boots, and never make themselves presentable and enter the house at all. No body can possibly be as wise as some of them look; and when they come to the fireside they are as dull and heavy as an old breaking-up plow. They do not appear to know that the most profitable stock a man can have upon his farm are healthy, happy, intelligent children; that even an Agricultural paper may have something pleasant to say to the boys, and something sweet to tell the girls; that to cultivate the taste, to quicken and strengthen a love of beauty, are as much the province of the Agriculturists, as to decide when turnips should be sown, or how calves should be weaned, or the analysis of soils. The RURAL NEW-YORKER neglects none of these things, and so renders itself good company in the household, and a welcome visitor."

—And here is an item from the *Worcester Daily Transcript* of the 20th inst.—received since the foregoing was placed in type—which so tersely commends the RURAL, and its objects and tendencies, that we are constrained to quote it in conclusion:

"Among all the agricultural papers of the country, we know of none which more nobly fulfill their mission than MOORE'S RURAL NEW-YORKER. It must be a welcome visitor to every household it enters. Its discussions of farmer's lore are broad and instructive; its encouragements to intelligent rural life are many and various; its cheering words to the young hopes of the household will put a meaning into many an unfolding life; and its ample pages will be found a treasury from which every dweller in the country can draw rich prizes."

LOOKING-GLASSES.

THE manufacture of silvered mirrors, as at present carried on, is one of the most curious of modern arts. The process of thus silvering glass mirrors is very simple. The sheet of tin-foil, somewhat larger than the mirror, is laid upon a smooth table, and quicksilver poured over it until it covers the tin-foil with a thickness of one-tenth of an inch or more; when the mercury has been swept by the edge of a stick to clean off the drops from its surface, the glass plate, scrupulously clean, is brought even with the edge of the table, and pushed gently forward sideways, so as to slide over the bath of mercury, its edge just dipping beneath its surface, so as to push before it all impurities, and to exclude all air-bubbles. Weights are then evenly applied over the back of the mirror, and the whole table inclined to such an angle as to favor the drawing off of the superfluous mercury. This requires some days or weeks, according to the size of the plate. Here is an additional risk and cost in large mirrors, since the time consumed is not small, and the danger of fracture imminent. The amalgam sometimes crystallizes, producing imperfections which require the renewal of the whole process; and the health of those engaged in it also suffers, and is finally destroyed by mercurial salivation.—*Life Illustrated*.

A BLIND guide is certainly a great mischief; but a guide that blinds those whom he should lead is undoubtedly a much greater.

The Young Ruralist.

WORK, AND THE LOVE OF IT.

MESSES. EDS.—I have noticed that there has been quite a war between some of the YOUNG RURALISTS for a few weeks past, and I have wanted to help on one side or the other had enough, but thinking "discretion the better part of valor," I have contented myself by looking on. Now, I come in and take a view of the field, after the combatants have retired. If they are not through yet, I'll back out quicker. The pen—a formidable weapon when wielded by a practiced hand—has been flourished pretty freely on both sides, and considerable ink shed, but I hope none of the competitors have been badly wounded.

I agree with HARRY HARRIS, when he says—"some persons pretend they like to work, and I pretend to assert that that is absolutely false." I don't call it work to go into the garden and weed onions half an hour every day, or scatter the dirt around two dozen hills of beans; but to roll logs from six in the morning till sunset, or pick up stone and put them into heaps, or build fence with heavy oak rails, when a person will feel the next morning as if the cartilage was started from every joint—that's work! It is not reasonable for me to suppose that a person should be censured for complaining of "constitutional weariness" under such circumstances.

I can see just how some of those would-be-industrious persons work. "O, dear! I must put my gloves on, or these little delicate hands will be stained and sunburnt, and won't be fit to be seen in a month! A man can be as honorable if he gets his living by his education as one who gets it by farming. The merchant is just as much entitled to a place in society as the farmer; and although his work is not the same, his row is just as wide and long as any other."

Many young men are persuaded that they must do just as their father's did, if they have been brought up on a farm they are good for nothing but farmers. That's not so. Must I grow broom corn for a livelihood, just because my father did? I have lived on a farm for fifteen years, and worked too, and when I wanted a leisure moment I had to take it, for it never came to me. I have a "repugnance" to farming, and I begin to think it's "natural." Like the man who did not like to saw wood, "I ain't built right!"

You may think that I am lazy, but there is no such word in my vocabulary,—though I had a very strong hint that way once when I did not hoe quite as much corn as my brother. But enough, let those farm it who like it.

DRAWN.

Beaver Dam, Wis., 1858.

LETTER FROM A MINNESOTA BOY.

DEAR RURAL:—I saw in a late number a letter from a correspondent in Oregon, and thought I would let your readers know something in regard to Minnesota, for I think it is one of the most desirable States in the Union. St. Paul (the present capital) is on the east side of the Mississippi river. It contains about 15,000 or 16,000 inhabitants. In morals the present St. Paul is not quite so perfect as the one of old. However, it is to be hoped that as he grows older he will be steadier.

There is one peculiarity about Minnesota rather strange, viz:—most of the rain falls in the night. Minnesota is a land of flowers. No one will deny this who has been up here. The editor of the *Pioneer and Democrat* says:—"In a space of twenty acres we counted no less than forty-seven different varieties." If that is not flowery what is?

I have one fault to find with your paper, viz:—you do not put any more articles on Natural History in the YOUNG RURALISTS' column. Now don't think me fault-finding. I was almost afraid to write to you, but as you promised the young folks to put their articles in "ship shape" and good order, I summoned up courage, and the "deed is done."

MINNESOTA BOY.

St. Paul, Oct., 1858.

HOW TO PRESERVE THE RURAL.—Can you tell us how the RURAL may pass through the hands of a half dozen individuals, be read and handled to satisfaction by each for one week, and be referred to every "now and then" till the close of the volume, and then be in a fit condition for binding? I have tried reading aloud, so that one reading would do for all, but to little purpose, as they have to be handled and seen, every inch of them, by all the family, before they are satisfied; so that at the close of the volume, I find that many of them are out at the elbows.—YOUNG RURALIST, Marion, N. Y.

REMARKS.—We don't know as we can help our young friend over the difficulty. As soon as a number has been read by the family, it should be filed with previous numbers. This is not only a convenience in referring to back numbers, but keeps them in good order. Any ingenious boy can make a good paper file. Try it, and if this fails, you will have to take two copies—one for present reading, and one for preservation.

FIRE-EATING.—I would like to be informed as to what "fire-eaters" use to prevent burning their mouths.—Y. L. C., Centralia, Ill.

REMARKS.—We keep our mouth from being burned by being careful not to put anything hot into it. Some fire-eaters not only burn their mouths, but their fingers. Diluted sulphuric acid we believe is the preparation used by magicians and others to give their flesh the power of resisting the action of fire. Several applications is necessary. No sensible boy would think of putting such stuff in his mouth, or of trying such foolish and dangerous experiments. Leave such things to the clowns.

CABBAGE ROTTING.—Will some of your readers inform me through the RURAL what will prevent cabbage from rotting? My cabbage rotted last season when the heads first became firm and solid, and are affected this season.—A YOUNG RURALIST, Williamsport, Pa., 1858.

STUFFING BIRDS.—Mrs. J. A., Paris, C. W.—The information needed you will find in the first four numbers of the present year.

PAA

THIRTY FISHING VESSELS REPORTED LOST.—The (Me.) Tribune reports serious disasters to the fishing fleet of Maine and Massachusetts, by which thirty vessels engaged in the Mackerel fishery are supposed to be lost.

The News Condenser.

FROM AFRICA.—The schooner P. A. Miller, at
vidence, Dr. J. from Gullimore river, brings
ws that Dr. Livingston had gone up the Nile
th the small steamer. The disturbances with
native tribes continued, and the new Governor
d started with a force of three native and forty
ropean troops against them. News had been
elved of a victory over the native Champanzee
the Zambesi.

led and six hundred sheep recovered. Two
diers were wounded. The mail conductor re-
ted meeting a large number of gold hunters
and for Pike's Peak.

—Immigration has fallen off. Only 8,000 arrivals at New York, since the 1st of January, against 10,000 for the corresponding period last year.

Foreign Intelligence.

Old World News.

During the past week four foreign steamers have reached our shores, the Ariel, at St. John, on the 19th; Anglo Saxon, Quebec, 19th; Europa, New York, 20th, and the Pacific, St. John, 21st inst. We condense the following from the files furnished by the respective vessels:

GRAND BRITAIN.—There is no improvement in the working of the Atlantic Cable at Valparaiso. The submarine cable company have issued proposals for \$150,000 additional capital, to lay two lines of cable from Hall to Elba, in Hanover, and turning it to Denmark.

The London Times says that all appearances indicate that the present Atlantic cable must be given up, and hopes that the experience gained will be used to insure that success which is finally certain. It admits the great superiority of the Niagara over the Agamemnon, and thinks that a ship should be especially constructed for the laying of the cable.

Later advices from Lady Franklin's Arctic Yacht Fox mention that the expedition had safely crossed the middle ice of Baffin's sea, and was in a fair way of accomplishing the object of the enterprise.

It was said that Sir Bulwer Lytton, prompted by the Canadian Ministers now in England, was giving special attention to a plan for the Federation of the British American Colonies.

The ship Daniel Webster, at London, passed on the 20th ult., a number of dead bodies, supposed to be from the burned steamer Austria.

The population of Limerick have started a project for a transatlantic line between France and America.

The Equinoctial gale had done considerable damage to shipping in the German ocean. Several vessels and loss of life are reported, but no American vessels are mentioned.

The new company for completing the Great Eastern has been delayed in its organization by the non-attendance of the directors of the old company, to complete the necessary forms.

FRANCE.—A meeting is to be held at Paris in November, to make arrangements for the construction of a canal across the Isthmus of Suez.

Rumors were afloat that there were two French ships of war at Lisbon, demanding the restitution of the bark Charles George. These rumors have since been confirmed. Compensation is claimed and will be awarded.

The Monitor publishes a circular forbidding un-stamped newspapers to insert advertisements.—This return to the strict letter of the law will be a death blow to a multitude of minor journals.

It is stated as certain that the Emperor of Russia has been invited by Prince Napoleon to visit France, that he has accepted the invitation, and that he will visit both London and Paris next spring.

The chess contest between Morphy and Harwitz, was suddenly closed on account of the illness of Mr. Harwitz. The game stood—Morphy 5, Harwitz 2, drawn 1.

The Independent of Toulon, says the visit of Prince Napoleon to Warsaw, is a prelude to an alliance between France and Russia, and predominantly hostile to Austria.

The French Admiral commanding in the Gulf of Mexico, had quitted Paris, for his post, with energetic orders to protect French citizens.

France exempts from navigation dues for another year, cargoes of corn, flour, rye and vegetables.

The Paris Press publishes the correspondence between the U. S. Minister to Nicaragua and the Foreign Minister to that Republic touching the conventions of Felix Belly.

The American Minister declares that no arrangement of Nicaragua with M. Belly shall be recognized or assented to, that it is contrary to the just rights acquired by American citizens, and that the liberal policy resulting from the Transit Treaty of November last shall be constantly maintained.

Nicaragua Minister replies that his government wishes only for justice and its rights. He desires friendly relations with the United States, but declares the Transit Treaty of no value, because the route was not opened at the stipulated period.

M. Belly appealed to the Clayton-Bulwer Treaty for protection, and Lord Malmesbury, in a letter to M. Belly, tells him that the stipulations of that Treaty will in his own opinion apply to his scheme if it is carried out.

AUSTRIA.—The reduction of the army is progressing rapidly.

The specie in the Bank of Austria amounts to eleven million pounds sterling.

PRUSSIA.—The King of Prussia has issued a decree establishing the regency of the Prince of Prussia.

SPAIN.—There is about being sent a large force of small war craft, to suppress piracy in the Philippine Islands. The health of the King again assumes alarm.

TURKEY.—The Montenegrins have hoisted their flag in Satorina, a territory on the coast of the Adriatic.

A Trieste telegram says that Lord Stratford had been instructed to express the regret of the English government at the bombardment of Jeddah, and that England intends to indemnify the sufferers. It is further reported that England will ask to return the island of Poros for 100 years.

ARABIA.—The cholera is said to have carried off 30,000 people at Mecca.

INDIA.—The Calcutta mail of Sept. 9th reached Pooley on the 3d inst. The news is unimportant. The Calcutta produce market is steady, and the import market brisk. Money was easy.

CHINA.—Hong Kong advices are to Aug. 24th.—Affairs at Canton were satisfactory. In punishing the late outrages at Canton, Gen. Vanstratzenberger with 700 men, sacked and burned the place. The troubles at Ningpo continued. There were large quantities of tea at Canton, awaiting the re-opening of trade for exportation. Trade has been resumed at Shanghai.

COMMERCIAL INTELLIGENCE.—Flour dull. Western canal 20¢. Ohio 24¢. Wheat very dull and nominal. Red Western 63¢. White 64¢. Corn lower but nominal at 32¢. Sugar 33¢. Coffee 34¢.

LONDON MARKETS.—Broadstuffs dull but steady. Sugar dull, and quotations barely maintained.

CLIPPER SHIP CAPTURED.—The American clipper ship Phantom, Capt. Quig, from Richmond, Va., for Pernambuco, was captured in a squall about the 23d ult., in Lat. 38° North, Long. 45° West. The masts were cut away and the vessel righted, but she became a complete wreck. The hatchway burst, and she became a complete wreck. After five days exposure, the crew were saved by the Spanish brig Tolo, and reached Havana the 11th. Capt. Quig came in the Black Warrior.

MEXICAN NEWS.—The steamer Gen. Bust arrived at New Orleans on the 18th inst., with Brazos dates to the 14th. The Mexican news she brings confirms the report of the battle between Vidauri and Miramon. It was fought near Chetumal and lasted four days.—Vidauri being badly defeated.—He had retreated to Monterrey, and was making preparations to attack Miramon.

From Arizona.

By private advices received in Washington, on the 19th inst., from Arizona, dated Sept. 28th, it is ascertained that the Sonora Silver Mining Company have begun shipping silver from Quebec to San Francisco, about a thousand ounces per week. This will be largely increased in a few weeks, when the amalgamation works are finished. Several other mines are well-opened, and melting commenced with large returns.

The Apaches were about making a great expedition into Sonora. The Mexicans were preparing for a large army to resist them.

Terceira's power is fully established in Sonora.—Gardara, leader of the great rebellion, being entirely deserted by his friends.

The proceedings of the Rio Grande convention, asking for the separate territorial organization of Arizona, had been unanimously endorsed by the western portion of the territory, and a mass-meeting held at Tucson.

No Representative or Senator was voted for in Arizona for the Mexican Legislature. On the 20th Sept., Lieut. Mowry was re-elected to Congress by about 3,000 votes. The American vote is largely increased since last year.

Lieut. Mowry has gone to Guyana, Sonora, to obtain, it is said, of the Legislature of that State, the right of way from Arizona to Fort Lomas and Guyana for a wagon road and railroad, and the transit of silver and goods free of duty.

The London Post-Office.

A visit to the London Post-Office, the other day, was a source of deep gratification. It is a building of stone, of huge dimensions, and in its various departments employs some 2,000 persons. Unlike the New York Post-Office, not a letter is delivered there to its owner. The whole delivery system in London is by carriers in livery, who, three and often four times daily, go through their allotted districts. This secures that promptness which cannot exist under the American system. The London Post-Office receives nothing after 6 o'clock P. M., unless a heavy advance postage is paid. It is a curiosity to see the men at the office just before the openings in the great hall are closed. Six o'clock within five minutes arrives, and the hurrying and crowd of people immense. Time advances and the numbers multiply. Only one minute remains, and hundreds hurry forward, throwing newspapers into a great window, while the large openings for letters are besieged. The Post-office clock begins slowly to strike the hour, and with it the rush is exciting. The last reverberation is scarcely heard before the great openings are shut, and dozens of legions without stand amusing themselves as best they can over their misfortunes.

How it is done.—We copy the two following "Marriage Notices," in order that our readers may perceive the very different styles of announcing the same general conclusion. The first is from a Sacramento (Cal.) paper, the second from a French journal.

YEEH AH WONG—HAW HE KWEI.—In Sacramento, Sept. 5, Yeep Ah Wong to Haw He Kwei, both of the Central Flawery Kingdom.

MALAKOFF—PANIEGA.—In Paris, on the 19th ult., His Excellency Aimable Jean Jacques Pellissier, Duke of Malakoff, Marshal of France, member of the Privy Council, Vice-President of the Senate, Ambassador of His Majesty the Emperor of the French to her Majesty the Queen of Great Britain and Ireland, Grand Cross of the Legion of Honor, decorated with the military medal, &c., &c., residing at Paris, in his hotel, Avenue des Champs Elysees, son of the defunct Pierre Pellissier and of Catherine Charlier, his wife; and Mlle. Marie Isabel Sophie Andrea Francisca de Paula Valera de la Paniega, residing at Paris, Avenue des Champs Elysees 87, daughter of Don Jose Valera y Viase, Marquis de Paniega, landowner, and of Donna Maria de los Dolores Alcala Galiano y Perey, Marquise de la Paniega, his wife, residing at Madrid.

CANADIAN WHEAT CROP.—The wheat crop of Canada, in 1868, according to returns received at the Bureau of Agriculture, is about 25 per cent. below the average of ordinary years. These returns come from forty-six different counties, of which thirty-six are in Upper Canada, where wheat alone is grown to any considerable extent.

THE OVERLAND MAIL.—The overland mail may be considered a success. The arrival of the second train from San Francisco, at St. Louis, bringing important news from the plains, signally demonstrates the utility of the scheme. Letters bearing San Francisco post marks of Sept. 20th, were received, but no newspapers, and it is thought that a sack of papers was left on the way somewhere.

GOOD NEWS.—A reduction in the prices of Sewing Machines is announced in our advertising columns. We have heretofore expressed the opinion that the prices of this invention have been too high—so high as to place them beyond the reach of many whom they would most benefit. Their utility is established beyond question, and at the present prices we see no reason why they should not be found, as they ought to be, in every household. Several varieties are manufactured adapted to various purposes. So far as public opinion has been formed and uttered, the preference is emphatically accorded to the Wheeler and Wilson machine for family use, and for manufactures in the same range of purpose and material. During the present autumn the trials have been numerous, and all the patents of any pretension have been brought fairly into competition. In every case, the Wheeler and Wilson machine has won the highest premium. We may instance the State Fairs of New York, New Jersey, Pennsylvania, Kentucky, Illinois, Wisconsin, and California, and the Fairs of the Cincinnati, Detroit, Chicago, and St. Louis Institutes, already held. At the Fair of the St. Louis Mechanical Association, the committee consisted of twenty-five ladies of the highest social standing, who, without a discounting rule, awarded for the Wheeler and Wilson machine the highest and only premium, a silver pitcher, valued at \$75. If these facts do not establish a reputation, we know not what can.

COMMERCIAL INTELLIGENCE.—Flour dull. Western canal 20¢. Ohio 24¢. Wheat very dull and nominal. Red Western 63¢. White 64¢. Corn lower but nominal at 32¢. Sugar 33¢. Coffee 34¢.

LONDON MARKETS.—Broadstuffs dull but steady. Sugar dull, and quotations barely maintained.

CLIPPER SHIP CAPTURED.—The American clipper ship Phantom, Capt. Quig, from Richmond, Va., for Pernambuco, was captured in a squall about the 23d ult., in Lat. 38° North, Long. 45° West. The masts were cut away and the vessel righted, but she became a complete wreck. The hatchway burst, and she became a complete wreck. After five days exposure, the crew were saved by the Spanish brig Tolo, and reached Havana the 11th. Capt. Quig came in the Black Warrior.

MEXICAN NEWS.—The steamer Gen. Bust arrived at New Orleans on the 18th inst., with Brazos dates to the 14th. The Mexican news she brings confirms the report of the battle between Vidauri and Miramon. It was fought near Chetumal and lasted four days.—Vidauri being badly defeated.—He had retreated to Monterrey, and was making preparations to attack Miramon.

THE OVERLAND MAIL.—The overland mail may be considered a success. The arrival of the second train from San Francisco, at St. Louis, bringing important news from the plains, signally demonstrates the utility of the scheme. Letters bearing San Francisco post marks of Sept. 20th, were received, but no newspapers, and it is thought that a sack of papers was left on the way somewhere.

GOOD NEWS.—A reduction in the prices of Sewing Machines is announced in our advertising columns. We have heretofore expressed the opinion that the prices of this invention have been too high—so high as to place them beyond the reach of many whom they would most benefit. Their utility is established beyond question, and at the present prices we see no reason why they should not be found, as they ought to be, in every household. Several varieties are manufactured adapted to various purposes. So far as public opinion has been formed and uttered, the preference is emphatically accorded to the Wheeler and Wilson machine for family use, and for manufactures in the same range of purpose and material. During the present autumn the trials have been numerous, and all the patents of any pretension have been brought fairly into competition. In every case, the Wheeler and Wilson machine has won the highest premium. We may instance the State Fairs of New York, New Jersey, Pennsylvania, Kentucky, Illinois, Wisconsin, and California, and the Fairs of the Cincinnati, Detroit, Chicago, and St. Louis Institutes, already held. At the Fair of the St. Louis Mechanical Association, the committee consisted of twenty-five ladies of the highest social standing, who, without a discounting rule, awarded for the Wheeler and Wilson machine the highest and only premium, a silver pitcher, valued at \$75. If these facts do not establish a reputation, we know not what can.

COMMERCIAL INTELLIGENCE.—Flour dull. Western canal 20¢. Ohio 24¢. Wheat very dull and nominal. Red Western 63¢. White 64¢. Corn lower but nominal at 32¢. Sugar 33¢. Coffee 34¢.

LONDON MARKETS.—Broadstuffs dull but steady. Sugar dull, and quotations barely maintained.

CLIPPER SHIP CAPTURED.—The American clipper ship Phantom, Capt. Quig, from Richmond, Va., for Pernambuco, was captured in a squall about the 23d ult., in Lat. 38° North, Long. 45° West. The masts were cut away and the vessel righted, but she became a complete wreck. The hatchway burst, and she became a complete wreck. After five days exposure, the crew were saved by the Spanish brig Tolo, and reached Havana the 11th. Capt. Quig came in the Black Warrior.

MEXICAN NEWS.—The steamer Gen. Bust arrived at New Orleans on the 18th inst., with Brazos dates to the 14th. The Mexican news she brings confirms the report of the battle between Vidauri and Miramon. It was fought near Chetumal and lasted four days.—Vidauri being badly defeated.—He had retreated to Monterrey, and was making preparations to attack Miramon.

Choice Poetry.

Written for Moore's Rural New-Yorker.
SONNET TO MORNING.

BY ORRIN F. ALLEN.

Now slowly fades the dusky hue of night,
And lo! the Morning Star on high,
As orient with joy the eastern sky
Gleams like a maiden's cheek with crimson light,
Walls, like some pageant stealing on the sight,
So's rosy car with magic mystery
Dissolves the mists that round his pathway lie;
Till naught of shade bedims the morn's delight.
Sweet matin songs from glen and grove arise
To hail with choral notes the march of morn,
For there's a joy beneath the glowing skies
That doth each scene with beauty's light adorn.
That when it glow from smiles of Paradise,
When Day first blushed to hail the rosy dawn.
Hickamack, N. J., 1898.

Written for Moore's Rural New-Yorker.
HOPE ON.

Hope on! hope on! though afflictions assail thee,
Hope on! there's a haven of heavenly rest;
Hope on! though the billows of trouble roll o'er thee,
There's a heaven above where the righteous are blest.

Hope on! hope on! though thy heart's filled with
anguish,
Hope on! and be patient, thy short race to run,
Hope on! though with sorrow thy heart may oft languish,
For thy SAVIOR, in kindness, will soon call thee home.

Oh! I would not live always in this world sin,
And I'm glad 'tis ordained we should taste death so
soon;
For troubles and sorrows our life usher in,
And the change that shall free us cannot well come to
soon.
Minnesota, 1898.

EVIL.

The Sketch-Book.

Written for Moore's Rural New-Yorker.
LETTERS FROM OUR FARM.—No. III.

There is something in the very name, October, that is suggestive of fullness, and ripeness. It brings to the mind visions of grapes swelling to the purple wine, showing like clusters of amethysts on the brown vines, as the last yellow leaves flutter away from them. Visions of orchard boughs stooping with their wealth of gold, and crimson, and russet, and dropping at a touch the ripened fruit on the ground, as if weary of holding it so long.—In the woods there are stores of nuts, and all the sunny day you can hear them falling. The boys are out among them, gathering their treasures for winter. How they shout and laugh as they pelt the loaded boughs, and chase the squirrels, that seem half disposed to dispute with them for possession of the property. If you have outgrown your boyhood, or girlhood, you cannot have forgotten the magic of a nutting excursion. There was no school on Saturday, you remember, and all through the week the children at the old brown school-house talked of little else, at noon and recess, but the nuts to be gathered on the holiday.

You were to start early in the morning, take your dinner, and stay all day in the woods. How delighted you were when your father came in to supper and said he thought there would be a hard frost. If he had said it was going to rain gold, you would not have felt happier than at the thoughts of the treasures "Jack Frost" would shake out of their covering. How father and mother laughed at the big basket you insisted upon taking with you next morning, and how proudly you took little WILLIE by the hand, and sallied forth.

You were triumphant enough when you found the chestnuts rattling down from their invincible armor, and the hazelnuts fairly bending the bushes with their weight, and long before night, baskets and pockets were filled. There were wild grapes in the woods, too, enough within the reach of your arms to give a luxurious dessert for your dinner, and a bunch to carry home to little NELLIE. What a happiness there was in your heart that day—nothing rational and definable, but such as fills the wild birds and bees—the mere delight of living, —a joy that was breathed into you by the wind, and fell upon you in the sunshine. Nature was a merry face to you then, a face that looked a laughing recognition from every tree, and rock, and flower.

Going home, somewhat wearily, with your loaded baskets, you and WILLIE gravely calculated the amount and value of your gleanings, and thought with a great deal of satisfaction of the long winter evenings, when you would sit by the great kitchen fire-place, feasting on nuts and red-cheeked apples, and telling wonderful riddles to each other, none the less amazing because they had been guessed twenty times over.

You are changed greatly since then, for now your pleasures grow wearisome as they are fairly tasted, and having once solved the riddles of life, you are only conscious of disappointment at their result, and half vexed at the eagerness with which you see others trying to find the solution.

Nature has a great deal of work to finish in this month of October, and she is working steadily at it day and night. Besides a thousand little jobs, whose doing escapes our notice, but which would make sad gaps in the beauty of next year if left undone, there is the corn crop to ripen and mature. In spite of evil prophecies from those who forget from year to year how bountifully this mother NATURE provides for all her household, in spite of wind and weather, untimely rains and frosts, there stands the harvest, rustling in the light airs of autumn, a wealth almost unmeasured.

All the spring-time the windows of heaven seemed to be open, and the rain poured down in such showers as threatened a second flood. If a gleam of sunshine tempted the farmers to their accustomed work, the rain soon put a stop to it, until they were fairly in despair. "No corn this year," said the croakers, and with some show of reason, only that it was once written that while the earth endureth, "seed time and harvest shall not fail." So while they grumbled NATURE only laughed at them, and said, "give me the corn,"

and have raised harvests there thousands of years;" and now see how the broad fields attest her unflinching skill. In a few weeks more the corn will be golden ripe, and ready for the binding, and then the last crop will be off the farm, and all ready to settle quietly into the stillness of winter. The few flowers that linger here and there about the woods and meadows, will fade out in the frosty air—the last leaf will flutter down from the maples, and the last bird leave the bough.

The buds for next spring will be carefully cased in double and triple wrappings against the cold and the wet. Never did a mother more tenderly protect her babe against the keen air, than does NATURE guard these delicate nurslings of hers. First she covers them with a downy fold softer than the finest wool, then with layer after layer, cunningly wrapped together, and finishes all with a coat of varnish, that turns every particle of moisture, and then she leaves the infant blossom as safe for the winter as the nursery pet in its dainty cradle. In a thousand sheltered crevices and corners she has stowed away little dingy cases, with mummy-like occupants, that are to make next year's butterflies, and live their little radiant lives among those same flowers, that are now packed away like so many prophecies on parchment—scrolls, waiting for spring to interpret them by glad fulfillment.

Already we have let go of the summer, and our thoughts, that a month ago went back to its sweetness with regret, go oftener forward now to think hopefully of another year. And yet there is much of beauty left to us, and some of it will linger far into the grey November. No pen can describe half the gorgeous dyes that the leaves flash out in the sunshine,—no cunning artist has ever fixed them upon canvas in half their brilliance. Green, and gold, and crimson, these are the colors, yet mingled and blended into an infinite variety of tints, not half of which have any name in our vocabulary. NATURE knows how to make a picture out of very few materials. She commenced two weeks ago to try experiments with a maple before my window. First she dashed a few of the outer boughs with cherry, that showed finely against the dark green of the rest,—then she turned the cherry into crimson, and stained half the leaves with it, and slowly, as if to mark the effect, colored leaf after leaf, till the whole was in a blaze of glory, since when she has been fading some parts into yellow, and darkening others into amber, and in a week more the leaves will all lie upon the ground, and the wind will pile them into drifts in the fence corners, and send them eddying about in little whirls and clouds. The nights are grandly beautiful, with their solemn starry majesty, but now and then come trailing dismal clouds, and lonesome winds, that go sobbing past the windows, and wailing in the dark with a cry that makes the heart feel desolate. Like a grey old harper comes this autumn wind, chanting weird melodies under your windows in the hush of the moonless midnight. Starting bewildered from sleep you listen, as well as you can for the heavy beating of your heart, to the songs that sound as if the voice struggled up through a weight of tears. You do not look out and smile on the singer—the darkness grows all the thicker for the tears that half blind you. Memory for a time is very busy with the lost hours of the summer—then you think of our FATHER and sleep again.

MR. PLOWHANDLE AFLOAT.

KART-TAIL COTTAGE, Oct. 1st, 1898.

COL. MOORE:—I'm more nor ever wanting your advice, and I hope you'll give it me pretty soon, for time is getting quite short.

IS CALLED UPON TO SERVE HIS COUNTRY.

You see, SMITH has been here talking to me about being a candidate for the Assembly this fall. I, of course, was very shy about the thing, and said I didn't think I was qualified, and that they would want a better man. But SMITH said that was all water, and I might just come right out and say I'd stand it. But I told him I couldn't make up my mind until I had consulted you, and mother.

"Well," says he, "it may be well enough to talk with the old woman, but what on earth has the Colonel to do with your affairs?"

"Why," says I, "ain't I one of the correspondents, and won't it make a considerable difference with him if I'm away from home and can't write?—the paper will miss me." He enmost laughed, when I said that.

"However," says I, "supposing I'm willing. I don't see how you can get up steam enough to put me through. There's JONES, he will go dead against me, besides the Captain."

PATRIOTISM.

"Why," says he, "it can be done just as easy as winking."

"Do tell me, then."

"You see, in the first place you must make up with JONES."

"But he's such a scamp."

"Never mind, when men want votes they snt very particular who gives them so they're of the right color."

"I don't believe he'll ever make up, even if I wanted to, which I don't."

"Now, I can fix it right off. You must say to me now, just here, that you think Esq. JONES a man of high legal parts, who would make a capital Judge."

"I'll see him in glory first! But suppose I say it, how are you going to get me started?"

"I've got that all fixed. We've got to have a new bridge over the Toomuddy next year, and if we don't get the State to build it, then the towns along the river have got to be taxed for it."

"And it will take a heap of money to do it, too."

"Be I am going to tell the people that we want a man that can take a high place, and can write for the papers, for our member this year, and if we get such an one there'll be no mistake about the bridge."

"Good idea."

"Then I'll say there's PLOWHANDLE, you see what a sensation he's made in the world with his pen, and if we elect him he'll be able to do big things for us."

HONEY.

You see SMITH had got me, but I didn't let him know it. So I sort of stretched myself up, and looked kinder grand, and says I, "Mr. SMITH fully

agree with you on the importance of a bridge over the Toomuddy, and that the State ought to build it—and it may be that I am a man that can command some influence, but I should prefer that my fellow citizens should pitch upon some other man."

"It's no use talking, JONN," says he, "you are going to be in for it, any how. But what shall I say to JONN?"

I considered that very important interests were going to hang on me, and that I ought to do all I could for my country, so, says I, "Mr. JONES has talents, and is a very capable man in his profession, and there are men who would like to see him Judge." You see I didn't commit myself, after all, to the pesky scamp.

"Now," says he, "if JONES wants to be clever to you, just put the honey right on to him, for you know it's said, 'more flies are caught with molasses than vinegar,' and you must use it freely."

"But," says I, "confound it, SMITH, I can't be sweet to all them vagabond rascals that loaf about the corners."

"Well, then," says he, "we can't get the bridge over the Toomuddy, that's all."

I finally told SMITH I'd be as sweet as honey in the comb to everybody.

THE PROVERB TRUE.

The next time I went over to the corners I met JONES, and he came up to me just as friendly as you can think. I knew in a minute that tarnal critter, SMITH, had been at him.

Says he, "I'm glad to see you to-day." "The same to yourself," says I, and then we shook hands as though we'd been the lovingest fellows in the world.

Says he, "Mr. PLOWHANDLE, we've been looking about for a man to represent us this year who has some influence, and can get us a bridge over the Toomuddy—and we all agree you're the man."

I put on a very surprised look, and says I, "you don't really mean any such foolish thing."

"Indeed we do, and I and my friends ain't going for any body else."

"Well," says I, "Mr. JONES, I haven't much to say about the representative—but I do say if the people go according to merit—there's a lawyer not far from here that's to be made Judge this fall."

Oh, golly! you should have seen how he flicked down the honey; I tell you I worked him handsomely. But, after all, Colonel, there's no way to make an animal so kinder come-after-you-good-natured, as to card 'em the way the hair lays.

Now, what I want of you, is to sort of say a good thing about me, in such away in your letter, that I can kinder break it to mother, for I'm afraid she won't consent, and then my fat is all in the fire.—Don't you think it would be a good thing for the RURAL if I went? I know it's going to be very hard for me to leave home, but I'll do anything for you and the public.

I'm going down to SMITH's to practice making bows, and taking off my hat in style to the women. SMITH says that's a kind of sweet'nin' that don't cost anything, and best be used pretty freely, especially when a man's got to run for an office, even if he don't exactly care for it. I tried it a little the other evening, before the glass at home, and sort of forgot myself, for mother says to me—"What on earth are you hobbing your head about so for, JONN?"

The fact is, I should have made better work of it if my hat brim hadn't been so pesky limber. Before I get down to SMITH's I am going to buy a new hat that's got a brim as stiff as a poker. I expect you'll consider this entirely confidential and write me right off.

Yours to Command,

JOHN PLOWHANDLE.

REMARKS.—We have heretofore regarded friend JOHN as quite unsophisticated, but fear he is becoming corrupted by the politicians, and that his cash, conscience and reputation will ere long suffer in consequence. True, FRANKLIN advised his young friend that he must "stoop to rise," but we think the politicians have literally "run the thing into the ground"—for they not unfrequently descend into the gutter, but perform many acts which are still more mean and contemptible. "About these days," as the Almanac-makers say, there is a vast deal of stooping and dirt-eating by party-patriots, office-seekers, et id omne genus; but as to Major PLOWHANDLE—we think we heard some one address Mr. P. as Major or General at the State Fair, the other day—inasmuch as he possesses ability, independence and sterling integrity, there is no necessity of assuming the chameleon-like colors or fawning manners of the demagogue. If, as is apparent, he is the best man to represent his district and secure the bridge, it is perhaps his duty to serve the people and State, even at some personal sacrifice—for we hold that every man who has "a stake in the hedge" (is a freeholder, and the head of a family) should, Cincinnati-like, leave the plow-handle for the field or forum at the call of his country. And if such men were always, or even generally, selected for prominent, responsible and lucrative positions—men of merit, competency and unquestioned integrity—ours would soon become, in fact, the great and glorious country that the Fourth-of-July orators and editors of the Bankum Flag-Stuffs would fain make us believe it is already. But we are digressing.

Friend P. wants us to say a good thing for him, in order that "mother," (i.e., Mrs. P.) will consent to his serving as a member of the "Assembled Wisdom of the State," and also asks if we think such service would be a good thing for the RURAL. Now, as JOHN is happily situated in his domestic relations, we know it will not be pleasant for him to leave home—and moreover we fear it will cause mother much anxiety on his account, and extra care in superintending the family, farm and stock.

But still, Mrs. P. ought to consider that she also is under obligations to the country—albeit not permitted all the "rights" which some of her sex demand—and that, though hard to part, even for a hundred days, she should not keep her husband from a position he is evidently qualified to occupy with credit to himself, and benefit to his constituency and the commonwealth. And, beside, as SAM and SUSAN are yet unmarried and still at home, she will have good company and assistance. As to the RURAL, that may and undoubtedly will suffer from the absence of our able, popular and highly esteemed correspondent, but we trust our readers will, with us, make some sac-

rifices to promote the common weal. And we are not sure but it will be best, even for the RURAL—for, though it suffer temporarily, will not Mr. P.'s greater experience and knowledge of men and the world enable him to write still better next spring? Such is our hope, at least, and we confidently believe that we shall then have the pleasure of introducing him to a largely increased audience—say nearly or quite five hundred thousand RURAL readers. So mote it be.

Corner for the Young.

MISCELLANEOUS ENIGMA.

I AM composed of 16 letters.
My 9, 4, 15, 3, 8, 1 is a coin not possessed by every one.

My 12, 7, 5 eats the same food as the Chinese.
My 2, 13, 1 is an article of apparel.

My 5, 4, 14, 6, 3 is a welcome place for the epileptic.

My 10, 12, 13, 8 has accomplished wonders.
My 14, 15, 3, 13, 9 you have often heard.

My 1, 5 is wrong.
My 6, 16, 8, 9 is a religious festival.

My 11, 2, 4, 0 is a conversation.
My 5, 4, 9, 1, 15, 3 you must not do.

My whole is found in the depths of the ocean.
Wauwaton, "Badger State." "Country Girl."

THE ONLY ARTICLE UNRIVALED IN MARKET, WITH IMPROVED HOME AND EUROPEAN DEMAND.

THE reason why, is that by Nature's own process it restores the natural color permanently after the hair becomes gray, supplies the natural fluids, and thus makes it grow on bald heads, removes all dandruff, itching, and heat from the scalp, quells and tones up the nerves, and thus cures all nervous headaches, the only being used upon to cure all diseases of the scalp and hair, it will keep it cool and keep it from falling off; makes it soft, glossy, healthy and beautiful, and if used by the young two or three times a week, it will never fall or become gray; then read the following and judge for yourself.

NEW YORK, Jan. 5, 1888.

MESSRS. O. J. WOOD & CO. Dear Sirs:—Having heard a good deal about Professor Wood's Hair Restorative and my hair becoming gray, I made up my mind to try and lay aside the prejudices which, I, in common with a great many persons, had against all manner of patent medicines, and a short time ago I commenced using your medicine to see if it would do me any good. The result has been so very satisfactory that I am very glad I did so, and in justice to you, as well as for the encouragement of others who may be as gray as I was but who having my prejudices without my reason for setting it aside, are unwilling to give your Restorative a trial, I will have further proof and the best proof being a demonstration, I write you this letter, which you may show to any such, and also direct them to me for further proof, who am in and out of the N. Y. Wire & Cable establishment every day.

My hair is now its natural color and much more in appearance every way, being glossier and thicker and much more healthy looking. I am, yours, respectfully, HENRY JENKINS.

Our Columbus and Carroll Sts., Brooklyn. The Restorative is put up in bottles of 3 sizes, viz., large, medium, and small, the small bottle, a pint, and costs for one dollar a bottle, the medium bottle at least twenty per cent more in proportion than the small, and the large for two dollars per bottle. The large bottle a quart, 40 per cent more in proportion, and costs for \$1 per bottle. O. J. WOOD & CO., Proprietors, 112 Broadway, New York. (In the great New York Wire & Cable Establishment) and 114 Market street, St. Louis, Mo.

And sold by all good Druggists and Fancy Goods Dealers.

69 and 71 Main Street, adjoining Osburn House.

ATTRACTIVE DISPLAY OF FALL DRESS GOODS, ELEGANCE, BEAUTY AND VARIETY ANY PREVIOUS ASSORTMENT.

HUBBARD & NORTHRUP invite particular attention to their unusually extensive variety of DRESS GOODS, the most extensive in market.

SHAWLS of the latest patterns. DRESS GOODS, the most extensive in market. SILKS of the richest and newest styles. EMBROIDERIES of the rarest and newest work.

DOMESTICS. The Stock of Domestic offered by Messrs. Hubbard & Northrup contains the best and most approved makes to be found in market. They devote particular attention to their domestic trade, and HOUSE-KEEPERS AND HOTEL-KEEPERS will find it for their interest to examine their complete stock.

MOORE'S RURAL NEW-YORKER,
AN ORIGINAL WEEKLY
Agricultural, Literary and Family Newspaper.

CONDUCTED BY D. D. T. MOORE,
WITH AN ABLE CORPS OF ASSISTANT EDITORS.

THE RURAL NEW-YORKER is designed to be unsurpassed in Value, Purity, Usefulness and Variety of Contents, and unique and beautiful in Appearance. Its Conductor devotes his personal attention to the supervision of its various departments, and earnestly labors to render the RURAL an entirely Reliable Guide on the important Practical, Scientific and other Subjects intimately connected with the business of those whose interests it ardently advocates. It embraces more Agricultural, Horticultural, Scientific, Educational, Literary and News Matter, interspersed with appropriate and beautiful Engravings, than any other Journal, rendering it the most complete AGRICULTURAL, LITERARY AND FAMILY JOURNAL in America.

All communications, and business letters, should be addressed to D. D. T. MOORE, Rochester, N. Y.
For Terms and other particulars, see last page.

Rural New-Yorker.

NOTES ON MANURES, &c.

The following brief notes are written in answer to inquiries received from correspondents. This will account for their miscellaneous and somewhat disconnected character. We have selected inquiries mainly on the subject of MANURES, and in the next number may give similar notes in answer to inquiries on other subjects. If in any case the experience of any of our readers is such as to cause them to differ from opinions expressed in these or other articles, they can do the community of farmers no better service than by giving the facts publicly through the columns of the RURAL.

Liquid Manure.

It is true, that the greater portion of our liquid manure is wasted, and it is also true that this is the most valuable part of the excrements of animals. These two facts admitted, the necessity for a change is at once apparent. In Holland not only is the liquid manure carefully preserved, but the solid manure is mixed with water, and applied to the land in a liquid form. Those who have experimented with liquid manure in growing fine vegetables, &c., know its value. It is a *power* in the hands of the skillful gardener. We have planted fruit trees in full flower, and by the frequent and persevering application of liquid manure to furnish the constant demand upon the trees, which the injured roots could not supply unless it was given in this convenient form, have succeeded in perfecting a large crop of fruit, (more than enough to pay for the tree) the first year, and without doing it any injury. The President of the Fruit Growers' Society of Western New York, often tells his friends that the finest, highest-colored and best flavored Duchesse de Angouleme pears he ever saw or tasted was a few given him by us a few years since. These were raised on trees the first year planted, which it is not likely would have grown a perfect fruit without the use of liquid manure. Then we have grown Celery and other vegetables of almost fabulous size in the same manner.

Now, if this manure is so useful in the hands of the gardener, may it not be of value to the farmer in specific cases, in forwarding a tardy crop, in giving strength and vigor to the sickly or feeble plants, just at the time when the success or failure of the crop seems to be hanging in the balance. A hoghead may be rigged on a cart or wagon, for applying the manure. For saving it, the floors of the stalls may be made to incline to a drain or gutter back of the animals, with which a pipe must be connected to convey the liquid to a tank in the cellar, or some out building lower than the stable floor. Liquid manure is very strong when collected in this way and will need to be diluted with about four times its bulk with water. It should be first tested by watering a few plants.

Manure Cellars.

These are of advantage to the manure, but we have often thought they were of no benefit to the animals living and breathing over them. They are very convenient too, nothing can be more so. To have a hatch in the stable floor through which all manure may be thrown and all refuse swept is very convenient, and insures a clean stable. The liquid manure, too, is more likely to be saved in this way, and the whole losses but little of its valuable parts. The question is whether those who have not such a cellar cannot secure nearly the same results, by composting with materials that will prevent the escape of ammonia.

Fixers of Ammonia.

We say nothing about the acids or salts used for this purpose, because they are not such as most farmers will be likely to use. The end desired they can accomplish better by the use of material always on hand and that costs little or nothing. Charcoal dust is the very best thing for composting with manure. At least next to this in value is swamp muck. All refuse porous stuff, weeds, the scraping of roads, &c., are valuable. Leaves make

a good manure, and in answer to a particular inquiry on this point we will say the autumn is the best time for gathering.

Manure Affected by the Feed.

It is not the kind of animal, so much as the kind of food it consumes that affects the value of the manure. Not many years since, while attending the Annual Meeting of the N. Y. State Agricultural Society at Albany, a gentleman of intelligence informed us that he had commenced keeping and breeding Durham stock, on account of the value of their manure over that produced by native stock. The difference in the manure, with the same feed would hardly be perceptible. The manure of fowls is of the highest value, because they live on grain, insects, &c., all the richest kind of food. The manure of the horse is more valuable than that of the cow, as usually kept, because the horse consumes more grain than the cow. The mechanical condition of the manure affects the result somewhat. Cow dung, for instance does not crumble down like horse dung, and therefore is not so easily or evenly distributed over the land. The quantity as well as the quality of food affects the value of the manure. If an animal receives only sufficient food barely to sustain life, this food is much more thoroughly used up in the animal organism, and the manure will be less in quantity and poorer in quality than though enough was given to produce flesh and fat. For this reason, as well as others, the manure from fattening is richer than that from store animals. The age of the animal too, affects the quality of the manure. Food given to young animals that are producing bones and muscle is more completely consumed than that given to those of mature age, and consequently the manure is poorer. One thousand pounds of the urine of a calf fed on milk was found to contain but one pound of solid matter, and only a trace of ammonia; the same quantity of urine of a full grown cow contained 80 pounds of solid matter and eight pounds of nitrogen. This will show plainly how much the condition of the animal affects the manure.

Soiling, Will it Pay?

This is a question which it is difficult to answer, without a knowledge of the circumstances in which the inquirer is placed. Did we wish to keep a large amount of stock on a small piece of ground we should out their feed, by all means. The reason the system has not been generally adopted in this country is, that land has been cheap, and labor scarce and dear, and it was thought best to allow animals to out their own feed. This idea was sometimes carried to extremes in the West, as the hogs and cattle were turned into corn fields to pick their own corn. This we have never seen, but we have some farmers whose usual mode of feeding the cattle in the fall was to go to the field and cut a few arms full of corn and throw them to the cattle. By such a course the largest half was wasted, but labor was saved. Whether such a course was over the right one we very much question. It certainly is not now, when land and crops and animals are valuable. The rule now is to make the most of everything, and grinding and cooking, feed, and soiling are matters not only talked of but practiced to some extent by the most intelligent farmers. In Europe Vetches and Red Clover are grown for soiling but in this country nothing that we know of is likely to supersede corn. At the discussions at Syracuse during the State Fair T. C. Parsons, stated that he had grown Western corn for fodder and obtained at the rate of twenty tons to the acre when cured. This would give a large amount of feed if cut green. Perhaps in no other way could as much be raised on an acre. A gentleman inquired of the dairy-men present if they found it profitable to grow corn in that way for foddering or for soiling milk cows. To this there was a most hearty and unanimous response in the affirmative. In fact no question asked that evening received such a decided answer. This shows the opinions of practical men on the question.

DOES UNDERDRAINING PAY?

My answer is, sometimes it does—sometimes it does not. I figure out my reasons thus:—Take an average specimen of hard-pan land, or that which is cold and wet, with an average location, and where average prices prevail; read an essay on ditching, work yourself up to fever heat, summon your cash, drive ditches through your whole farm two rods apart, three feet deep—if more than two rods apart, some of your land won't be drained, and probably not even at that distance—this will give eighty rods of ditch to the acre, which will cost, generally, over fifty cents to the rod, whether you use tile or stone—don't indulge in any unpleasant conjectures as to the possible failure of the ditches in time to come—and the account will stand:

Cost of land, cleared and improved, per acre.	\$30
Cost of draining, per acre.	45
Cost of drained farm, per acre.	\$75,

worth about half as much when drained as medium Livingston County lands, which can now be bought at from fifty to sixty dollars per acre.

It will take a bold man, up in Steuben or Cattaraugus, ten miles from the County seat, a mile from the "four corners," two miles from the store, blacksmith shop, saw mill, grist mill, shoe shop, some ways to meeting, and further to market,—it will take a bold man up there, half way from somewhere to nowhere, to ask seventy-five dollars per acre for his drained hard-pan land, and it will take a bolder man than Julius Caesar to buy it at that figure. Farms of that quality, managed by common country brains, haven't paid, as a matter of history, four per cent. per annum on \$75 per acre, and there is little probability that they will for the next five years.

It would cost at this rate, Five Hundred Millions of Dollars to drain one-half of the improved lands in New York and Pennsylvania; the interest on that sum would be thirty-five millions of dollars annually. How is this to be paid? By the increased production of the land, if at all. But if you should raise additional products sufficient to pay this interest, and the expense of growing and marketing the same, you would glut every market in Christendom—then the products would bring next to nothing, and so the debt couldn't be paid at all! The simple fact is, a general system of draining would produce universal bankruptcy. Agricultural products don't bring enough in the back country to warrant the outlay, and farmers generally have the sense to see it. To drain all the improved lands in the Union, would cost more than the United States—including every man, woman, and child—is worth.

I am not opposed to draining—I have repeatedly spoken well of it, and I mean now to do what its ultra advocates have never done, to my knowledge, point out the circumstances under which draining will pay, and the circumstances under which it will not. Let me premise that in settling any country, the best lands are taken first—those that will yield the largest returns with the least labor—advantages of location, however, sometimes counter-balance advantages of soil. That mistakes are made in selections, there can be no doubt; but mankind have always sought anxiously for the best lands within their reach. With the increase of population, agriculture must improve, or enlarge its area by the addition of inferior lands. Practically, it will be found that some branches of husbandry will bear transplanting to inferior soils sooner than others, as, for instance, grazing. In process of time, however, the increase of population, and the consequent demand for agricultural products, will force a more extended cultivation of inferior lands, and then it is that underdraining will be profitably introduced. England and France, and most of their continental neighbors, have doubtless arrived at this stage. They not only sell their produce high, but they buy their labor cheap. The improvements by which they augment their crops are made with a comparatively small outlay, while their increased productions sell for a high price. It would be very lame logic to infer that because it would pay to ditch a farm in the county of Cork, it would pay to ditch one in Wisconsin, where the yield would not bring half as much per acre, and the cost of ditching would be twice as great. I assume, what will hardly be denied, that we have lands in the United States which will bring good and remunerative crops without ditching—we have such lands in Western New York, and they abound in the Western States. They are the lands that discreet men select for settlement first. At the same time, it must be conceded that there are inferior lands that make up by their proximity to good markets, what they lack in quality of soil. The lands near New York and Boston will be cultivated, though poor, and in respect to the policy of draining them, they are in Cork or Kerry. I assume:

First. It will now, Anno Domini 1858, do to underdrain the lands contiguous to our large towns and best markets.

Second. It will do to underdrain, anywhere on the face of the earth, all gardens and fruit orchards on wet or heavy soils. The expense of drainage is a small item compared with the continued expense of their cultivation, and compared with the value of their products under good management.

Third. It will do to drain some of our best grain soils,—tolerably well located,—troubled with excess of water, (as, for instance, Mr. JOHN JOHNSTON'S farm, near Geneva.) Good, well managed grain farms occasionally yield crops worth fifty, sixty, and even eighty dollars the acre—they are entitled to a few tile if they want them.

Fourth. It will do to run occasional drains, which, by cutting off springs or surface water, dry muck land at little expense.

Fifth. It will do to use any time and means that can be spared, to drain a few acres, more or less, near the barn where the manure is to be applied to the growth of corn, potatoes, &c.

Let it be remarked, however, that it will never do to incur the expense of ditching unless the subsequent

INSECTS INJURIOUS TO THE POTATO.

1. Red Acarus.
2. Acarus farinæ.
3. Ixodes, (Wood Tick.)
4. Acarus scabii, (the Itch Insect.)
5. Potato Weevil, (a, b, c.)

6. Phytocoris.
7. Aphids, (a, b, c.)
8. Striped Cucumber Bug.
9. Potato Bug, (Lema Solani.)
10. Psyllus Cornutus.

tillage is to be good—as bad tillage, even on drained land, will not pay for the expenses incurred.

There is one thing that the ultra advocates of ditching should bear in mind. We have a large portion of spouty, hard pan land, which, when thoroughly drained, at the expense of fifty dollars an acre, will then be second, third, fourth and fifth-rate land, and will not bring the cost of drainage, though exposed for sale in every market in Christendom! I am not willing that the owners should be deceived by the eloquence of our modern lecturers and essayists into the expense of draining it. I have observed that whenever the editors of the *Tribune*, *Country Gentleman*, *Rural*, *Boston Cultivator*, &c., &c., make speeches or write articles, and have nothing to say, they at once hinge upon ditching, and each time they run the thing further into the ground! While I admit that some lands will yield more and better grass after being ditched, I hold that at present it is not profitable to drain our grass lands, as a general rule,—properly stocked and managed they will supply our necessities and the necessities of the country without.

In reference to "the West" it may be remarked, that back from its large towns, there can be little land that it will pay to ditch—there is so much land "Out West." I may judge, from what I have seen and heard, that a man had better take up a new and dry farm than to undertake to drain a wet one. He can buy two dry ones for what it will cost to underdrain one wet one—in short, the "progress of population" does not yet require the culture of inferior lands.

Finally, I concede that in the indefinite future, it will happen that all tenacious soils will be profitably underdrained.—H. T. S.

POTATO INSECT—HENDERSON'S THEORY.

[SEE ILLUSTRATIONS ABOVE.]

EDS. RURAL.—While I admire the zeal of Mr. HENDERSON and would by no means join in with the "wholesale denunciation" of which he complains, I cannot avoid noticing his communication in the RURAL of the 9th inst. He therein refers to Mr. RAYMOND'S letter, sent with my communication, and found in the RURAL of August 21st, as a "complete answer"—because Mr. R. says that the "Phytocoris linearis, of SAY, approaches nearly to the *P. pratensis*, a foreign species, which also has the V mark on the scutellum."

This certainly has no bearing whatever on the question at issue. Mr. R. distinctly dissents from Mr. H.'s theory of their early propagation, because he says "It is impossible that they should cohabit in ten days after their expulsion from the egg, unless they should have, within that time, passed through all their transformations, and have attained their mature or perfect state." Mr. HENDERSON asserts that he has "again and again seen the young insects cohabiting, but never the full grown." He stands the case between those parties. I do say that I have seen the winged male *Aphid* in connection with a wingless female one—so late in the season as Nov. 20th. This is also contrary to Mr. HARRIS' belief—as to the *Phytocoris* I neither assert nor deny.

Mr. RAYMOND also says of these insects in the

"larva state," that "their habits then are similar to the mature insect"—by this he simply means as regards their feeding and form, excepting the wings and propagation only, and to be otherwise construed would be to make him flatly contradict himself. Mr. HENDERSON, however, quotes it as bearing him out in his statement.

What induces me to receive Mr. HENDERSON'S statement doubtfully is the fact that he quotes part of Mr. SAY'S paragraph 246, where he says "a very small insect which is constantly to be seen upon tubers, is a small *Acarus* &c." This insect is figured by Mr. INGALL, who also remarks, as quoted in the same paragraph—"that this little fellow when viewed under the microscope travelling among the dense growth of fungi, put him in mind of a great rhinoceros trotting about in a jungle." Mr. HENDERSON says of this same *Acarus*, "Now, this is precisely the young *Phytocoris* such as you (Mr. Editor) said looked like an animated dew drop," and declares that he has watched this insect from the time it first made its appearance until it got its wings! Fig. 1 is a copy from SAY'S *red Acarus*, which preys upon aphids, and is therefore a friend to the horticulturist. Fig. 2, the *Acarus farinæ* of SAY, which he found abundantly on the diseased potatoes, and is the one figured by Mr. INGALL. These you observe, are eight footed creatures and are classed among the Arachnids or spider family. Under the name of *Mites* they are universally known, and when some of our most essential articles of food, as cheese or flour, get old or musty, they soon swarm with these minute microscopic animals; and when once established multiply beyond conception. They not only attack decaying matter but also living creatures.

The immediate cause of the Itch, is now ascertained beyond a cavil to be the presence of an insect called the *Acarus scabii* found, not in the vesicle, (as stated by GALT,) but at the end of a small redish farrow, which begins with the vesicle and ends with white, corpuscle-like *acarus*. Fig. 4 shows the upper and lower side of the *Acarus scabii*. Various species of beetles and other insects and animals in the air and water and on land are infested by one or another species of this extensive group of parasitic creatures.

The red spider of our hot houses, is the *Acarus telarius*. Under the name of *Ticks* (*Ixodes*) they attack dogs or persons, and are annoying to those collecting blackberries in the woods. Doctor MORSE, of Mount Joy, brought me a species of wood tick (Fig. 3) taken from the arm of a small girl, half imbedded in the flesh while sleeping under a shade tree near a wood. These figures are all more or less enlarged.

Certainly, Mr. HENDERSON does not mean what he says. That the *acarus* gets wings and becomes transformed into a *Phytocoris*. This leads me to receive his testimony with doubt as to the accuracy of his judgment, and of course would not willfully misrepresent him, and hope that he will be more definite if his article has misled me.

It may be well to remark that there are quite a number of insects accused of injuring the potato vines. What is commonly called the *Potato Fly*,

includes three species of *Lytta*, namely the *L. vittata*, *L. cinerea* and *L. atrata*, and are confounded without a suspicion that they are distinct species. These belong to the blistering beetles, or *Cantharididae*. The green Spanish-flies sold in the shops, are found in the south of Europe. Our striped *cantharis* is also of use for blistering—the *L. nitida* or potato-fly. The narrow-necked oil-beetle *Mela angusticollis*, of Say, of a dark indigo blue color, is also frequently found eating the potato leaves. The potato-bug, *Crioceris trilineata* of Olivier (Fig. 8), now the *Lema trilineata* of Fab's, about 1/4 inch long, of a rankin-yellow color, with two dots on the thorax, and three black stripes on the wing covers. These and the *Lema solani* (Fig. 9), which is yellow also with black shoulders and ends of the wing covers, eat the leaves of the potato, gnawing irregular holes through them.

Fig. 6 is the Hemipterous insect of Mr. HENDERSON, the *Phytocoris incoloratus* described and figured by PALIST DE BEAUVOIS, (the name *Phytocoris* means plant-bug,) and it is a variable species.

Fig. 7 represents a wingless and 6 the winged *Aphis* or plant louse. Some plant-lice live in the ground, and derive their nourishment from the roots of plants. HARSH says, "upon pulling up China Asters, which seemed to be perishing from no visible cause, I have found hundreds of little lice of a white color, closely clustered together on the roots." No winged ones were seen, they may be allied to if not identical with the European *Aphis radicum*. Mr. B. might easily mistake those for the young *phytocoris*. They certainly do breed fast enough. What is called the potato worm, like the tobacco worm, is the larva or caterpillar of a *Lepidopterous* insect; the *Sphinx quinquemaculata*.

Mr. LOUIS C. LITE, of the Enterprise Nursery in this county sent me a bundle of potato stalks, channeled through their entire length by a yellowish grub, (Fig. 5, letter a,) at the base near and some in the root. I found the pupa in all stages, Fig. 5, b, clearly revealing it to be one of the snouted beetles. I also had several perfect insects (Fig. 5, c,) which proved to be a species that I was unable to name among the ninety-nine genera, recognized as American *curculionidae*—is of a slate color, hair short, appressed. I have specimens, and design to discover which species it is before I am done with it, if described at all. When we reflect that there are 4,000 species of weevil described, it makes us cautious in giving specific names. These evidently sapped the very vitals of the vines, and must be as deleterious as any other insect yet described. I have had ample proof of it, hence they are quite as injurious if not more so than the *Aphis* or *Phytocoris* where they infest the plants.

The above illustrated group and described insects, infesting the potato, are but a part of them that are more or less accused of doing mischief, which are submitted for the benefit of your readers.

JACOB STAUFFER.

JOTTINGS FROM CONNECTICUT.

Groton Monument—Town of Clinton—Farms and Farming—Fish Manure—Cattle—Fruit, &c.

EDS. RURAL:—In my last I left my readers rather abruptly. I was speaking of standing on the top of Groton Monument viewing the scenery presented to my view, and also of the thoughts passing through my mind at the time, when suddenly I found 'twas time for the mail to close, and I stopped short—not even telling whether I descended terra-firma-wards as safely as I "went up." Such was my fortune, however, and in the evening returned to Clinton, weary, but feeling well repaid for my short though pleasant journey, entering, on the following day, upon the duties of school, with renewed vigor. How much real good it does one to throw off all care at times, and go forth to gaze upon the many beautiful scenes both of Nature and Art to be met with on every hand.

In my last I promised to give my Western friends a sketch of the town from which I write, its location, quality of the soil, and the manner in which farming is conducted. First, the location. Clinton is a quiet little village of 1,500 inhabitants, and is located on Long Island Sound, some ten miles west of where the Connecticut discharges its waters. As you go back from the Sound, the land gradually rises, presenting some fine scenery, and a fair view of the Sound, on whose silvery bosom may be seen at all times sails of various descriptions. In the war of 1812, the British attempted to effect an entrance to the harbor, but owing to the watchfulness of the inhabitants, were successfully repulsed, and there is now living in the village one old veteran, (past 90,) who, unaided by any save a servant to load his musket, completely disabled a whole boat's crew who attempted to land, killing and wounding all, save one man. Even now the old man's eyes will sparkle as he relates his story of 1812. By the way, he has voted for every President, (with the exception of the present one,) from Washington to the present time. How few there are living at this time who can say thus much.

The soil—as with most places along the Sound—is a thin, sandy loam, better adapted to grain than pasturage. Along the shore are extensive flats, affording quantities of salt grass, which is out every September for winter use. Cattle will not thrive on it as they do on upland hay, but it answers to mix in along as seasoning. Much of the hay is shipped off to neighboring cities—the same of the straw. This course tends, without doubt, to diminish the strength of the land—for in my humble opinion no man can be a successful farmer unless he keeps up his farm by constantly top-dressing it with good, strong manure, which is not often done when but little stock is kept on the premises. The common practice of farmers here is to fish their land (as they term it.) By this, I mean use fish as a fertilizer. But, methinks, I hear some Western friend ask in astonishment, can fish enough be caught for this purpose?

The fish used are the Whitefish that swarm the waters of the Sound in the summer season. These will average half a pound each—and they go in "schools"—(not graded schools, such as Connecticut begins to boast of, where the young idea is taught "to shoot")—but fish schools—congregating promiscuously. That you may form some idea of their plenteousness, I will say they are caught during the fishing season, (July, August and September,) at the rate of from 200,000 to 300,000 per week. A few days since 50,000 were caught at one haul. They are sold at \$1.25 per thousand. The usual quantity for an acre of ground is from 8,000

to 10,000—say from \$10 to \$15 per acre. The usual practice is to plow them in—though they are sometimes spread broadcast and left to decay on the surface. They are excellent dressing for grain, potatoes and grass—but if used exclusively, will run down the land, as the fish itself will make no soil, the principal ingredient that acts as a fertilizer being the oil—of which this species of fish contains a large amount. Of course the effluvia arising constantly from such a quantity of animal matter in a state of decomposition, is very offensive, especially to those not accustomed to it—but, as the eel said in regard to being skinned, it is nothing when one gets used to it.

As a general thing the land is too rough to use horses to work it—the team work being done by oxen. Farmers in this section raise and train their own cattle—consequently there are many fine animals in our vicinity—mostly native stock.

This is not a very remarkable section for fruit, though some kinds flourish well. For instance, I never saw larger, or more thrifty peach trees in Western New York, than are to be met with here. The soil and sea air seems well adapted to their growth. Grapes also flourish remarkably well. The vines are, this year, so far as I have seen, loaded with large, healthy clusters. In some sections of the State the grape seems to be diseased—especially the Isabella—for when about half grown it is seized with a dry rot, and often whole vines are stripped of their fruit. Apples flourish—though not as they do in your vicinity. The curculio, along and other vermin, destroy much of our choicest fruit. Why is it thus? It may be one of the means by which Providence forces man "to earn his bread by the sweat of the brow."

Perhaps my letter is lengthy enough for this time. If I have not wearied you I will soon come again with "Jottings from Connecticut." M. L. J. Clinton, Conn., Oct., 1868.

HARVESTING CORN—THE CORN JACK.

THE subject of Harvesting Corn has recently received some attention in the columns of the RURAL, and we wish to mention a handy implement for assisting the work, recently shown us by a friend in Chautauque Co. While the stalks are still rather green, as they are at the usual and best stage of cutting, not more than twenty to twenty-five hills should be placed in a stook, that both fodder and corn may cure properly. In our mode of cutting and binding, and then sitting in stooks, we have found it difficult to make them all stand under high winds—more or less usually blowing over. We bind, it will be remembered, four to six hills in a bundle, as it is thrown down in cutting. The implement above referred to is called a Corn Jack, and is made and used in the manner following:

A stake or post two and a half inches square and five feet long, has holes bored through at different heights, (to accommodate it to different sized stalks,) near the top for diagonal arms, projecting some eighteen inches on each side—these fitting loosely so as to be removed at pleasure. The lower end is sharpened so that it can be set in the ground firmly without trouble. It is placed where we wish to make a stook, and the corn as cut, is set up between the arms, which support it nicely until enough for a stook is ready. Then we have four bundles ready for tying without lifting or moving, and in place for a permanent stook. Tie them, slip out one arm, loosen and remove the stake or jack, and bind the stook together. It will stand firmly against a heavy wind, it is a small stook that will cure well, and when we wish to draw in before husking, is in good condition for that work.

Two men, one to cut and one to set the jacks, (two jacks are needed in this case,) and bind bundles and stooks, can harvest corn more rapidly and easily in this mode than in any other, doing as good work. There is no lifting the corn from the weeds and pumpkin vines, it is in good and firm position at one operation, and the implement is so simple that any man, who can use an inch auger, can make one. Besides, the job is finished up, no corn is left lying to be caught in a storm, as is sometimes the case when cutting goes on faster than binding.

REMARKS.—We gave this plan in the RURAL of September 8th, 1865, with this difference only that the stake had an iron point for convenience in driving it into the ground. The Corn Horse we gave last week is preferred by many, as it accomplishes the same work, and the trouble of driving the stake into the ground is avoided.

RURAL NOTES FROM IOWA.

DEAR RURAL:—As there are but few of your very excellent RURALS taken at our Post-Office, I thought it was not likely that you were receiving any word from this section of Iowa. So thinking, a few words from us might be of interest to some of your many readers.

The excitement of election in this State is over, and the farmers, we believe, will devote their attention to the crops yet awaiting harvest, with more earnestness than for the last two or three weeks. We are all anxious to learn how our sister States, Counties, &c., are getting along agriculturally.

There is one great and universal fault with the farmers of Iowa; and, as far as I can learn, it is about the same throughout the West. Being a new country the facilities for procuring land were, and still are, great—and the old maxim, "The more a man gets the more he wants," is well illustrated here. Almost every man coming to the country, gets, in the first place, all the land he can—say 160, 500 acres, or upwards—for a farm. In the second place, he gets all he can broken up, whether he is able to take care of it afterwards or not. The soil, being of unusual richness, produces almost invariably a good crop for three or four years, with but little cultivation. After this, instead of supplying the barns and stackyards (as before) with abundant crops, it produces a luxuriant and bountiful crop of weeds. The soil here is rich, but needs cultivation, as well as in New England.

The weather for the last two or three weeks has been wet and cold, making it quite unfavorable for the fairs. But for all, they were of much interest, and the Agricultural, Horticultural and Stock Departments presented a better show, than was anticipated. We are glad to say that the farmers of Iowa are taking more pride and interest in their high

and noble calling. The Stock exhibits improvement, and we believe there should be an improvement in the Stock's winter quarters. Generally you find but a small shed (as it is called) composed of a number of rude forks or posts stuck in the ground and a number of poles across—from six to twenty feet wide—with a quantity of straw baled from the ground on the north or west side, (sometimes both,) and upon the poles, sometimes not drawn to the top. This composes the winter shelter of the cattle.

The farmers are generally through with their threshing, and we can say we have not been disappointed. Oats were an entire failure—the wheat not much better. The corn crop will be fair—what was sown before the heavy June rains and not washed off, will be good.

The Sorgho, or Chinese Sugar Cane, is being well tried this season, the farmers, with but few exceptions, having raised enough to be convinced of its value. It proves to be an invaluable addition to the productions of Iowa. The molasses is of the finest quality. We have not seen any sugar made from this cane yet. W. W. JONES. Frank Pierce, Iowa, Oct., 1868.

TOWN FAIRS—WYOMING VALLEY.

EDS. RURAL:—The following brief article is submitted for publication with a desire to aid the cause to which your labors are so ardently and successfully devoted.

The results of some little effort by way of organizing a Town Ag'l Society in this town—Middlebury, Wyoming Co.—and carrying on, during the latter part of the past winter, a series of meetings for discussing various questions, have been so successful, judging from our town fair, just held,—that an extended notice of the same, may incite others to a similar useful work. A few words with regard to the locality. Hon. A. B. DICKINSON, in his address at the Wyoming Co. Fair, at Warsaw, this fall, remarked, that no country surpasses Western New York in beauty and fertility, and first among its valleys, was that of Allen's creek,* which he visited and admired nearly forty years ago.—Near the head of this valley is the flourishing village of Warsaw, the county seat of Wyoming Co. Thence the creek pursues a north-east but extremely winding course, through the eastern part of this town—through Covington, Pavilion, LeRoy, &c.—In the western part of this town is the valley of the Little Tonawanda. Consequently the surface is greatly diversified, the hills rising not to the sublime, but just to the beautiful, making the landscape pleasing and impressive.

The character and quality of the soil are, of course, various, generally, a strong clayey or gravelly loam, rather stiff, with a lack of sand for gardening purposes. Mr. DICKINSON considers Indian corn the best adapted crop. Barley, next.—The experience of the farmers here coincides with this view. He thinks it equal to any for dairy and stock.

No town excels this in sheep—they having been largely introduced from the best flocks at the East. Much fine stock is also raised here. A very great interest has been awakened in the culture of fruit. No region surpasses this for apples and pears, but peaches do not succeed so well. Grapes will probably be raised abundantly on our hill sides. J. M. QUALS, Esq., in the west part of the town has about six acres in grapes—F. W. CAPWELL has several acres. Prof. MORSE, in the village, has a splendid graper, also an extensive and highly cultivated garden.

In the quiet and ever-admired village of Wyoming is Middlebury Academy, one of the oldest institutions in the western part of the State. It embraces among its alumni many prominent men in State and Congress. It is at present under the charge of Prof. M. WEED assisted by Prof. MORSE, formerly principal of Hamilton Academy, and Mr. DRANSFIELD, from Rochester University. Rev. Doctor DEAN resides here, who your readers will recollect was for twenty years a faithful missionary in China. Hon. J. B. SKINNER, the democratic candidate for member of Congress, also resides here.

With an intelligent population, the formation of a Town Agricultural Society—though their disquisitions were not perhaps equal to those of the club of the American Institute—seems to have infused a general interest and prepared the way for the Town Fair which was held in this village last week. Of the Fair, space will only admit of saying, it was eminently successful. In the remarks of Gen. McELWAIN, President of the Wyoming Co. Ag. Society, also Doctor DORRANCE, President of the T. V. Society its superiority in many respects was admitted and highly commended. Addresses were made by Maj. BROOKS, ("H. T. B.,") Rev. Mr. DANIELS and Prof. WEED. A premium of \$5 for the best arranged yard and garden was paid by Prof. WEED and a like offer made for next year.—The favorable effects of such a premium are apparent in many a yard and garden. The Fair passed off happily. After a little moderate riding and driving, the crowd collected from this and the adjacent towns, dispersed, pleased, and no doubt, profited, resolving on future improvement.

Town Fairs may, no doubt, be highly useful and interesting, without detracting from the County Fairs. Will other towns form their Town Associations—hold their talks on the cold stormy days of next winter, and thus enter understandingly on the work of improvement? W. C. Wyoming, N. Y., 1868.

* It should retain its Indian name—Oatka.

POLL EVIL.

This disease, in the earlier stages of its growth, is completely under the control of the following specific:—Alcohol, 1 pint; gum camphor, 2 oz; oil hemlock, 1 oz; oil cloves, 1/2 oz; Venice turpentine, 1 oz. Apply, with the palm of hand, two or three times a day, rubbing the tumor well at each application. Continue the use of the remedy till the swelling begins to subside, and the soreness is removed.

The recipe was, for many years, a secret in the possession of a man who informed me that he had cured with it above two hundred cases of Poll Evil. Since I have known the ingredients, I have used and prescribed it in numerous cases, with invariably success. In one case the tumor was large, and contained matter; a free application of the reme-

dy did not diminish its size, but after breaking and running a very little, the excrecence soon dried up and disappeared.

It may be added that when a Poll Evil is cured by this repellent the horse is liable to a return of the disease. I had a mare cured that had a return of Poll Evil periodically once in two years. The same remedy proved continuously efficient. Milan, Erie Co., O., 1863. P. H.

THE RURAL—UNDERDRAINING

MESSES. EDS.:—While I was attending school, one of my fellow students brought a newspaper into the room, and that was the first volume of MOORE'S RURAL NEW-YORKER. Liking its appearance, and having something of a taste for agricultural reading and all pertaining thereto, I soon procured money sufficient to pay for the remainder of that and also the second volume, in advance; and I can assure you that as each number arrived, freighted with its variety of the good and useful, its contents were eagerly devoured by each member of the family. I now see by the number and volume on title page, that I have been a reader and subscriber to the RURAL nine years—and I think it has become what its Editor has designed—a model newspaper,—and so long as it maintains its present high position, you may consider me a subscriber. It takes first-rate in this town, as your list will show. For one, I have found very much to interest and instruct, and think it is through each means that a great share of the farming community have received new light, and are acting accordingly.

This is the first article I ever wrote for a paper, but seeing frequent invitations for farmers to give their experience—being assured that you would "fix it all right"—I have for once ventured. Fortune has placed me, of late, as proprietor of a farm, (always working on one,) and with this article I send you a specimen of one of its products, being three ears of corn, and under like circumstances, any of your readers may beat it who can, and I'll try again. It grew on a piece of land that, until this season, has been too wet to raise a crop of any thing, and never before plowed—water having stood on portions of it about nine months in the year. One year ago I gave it a pretty good draining with tile, and it being in sight and hearing of the highway, as we were at work some of the passers-by thought "he (I) might be in better business,"—and "he could ditch there until he got tired;" but I told them to wait a little and see; and their tune has been changed to, "I don't know but he will make something of that after all,"—and, "there is a piece of land I never saw plowed before,—see what fine corn." But to the crop. In the spring I fitted it for corn, and planted the most of it on the 10th of May, and with all the wet weather we had about planting time, I saw water standing on it but once, and that in a "dead furrow." It was hoed twice, ripened well, and we have just finished husking. The yield from one half an acre, measured, was 68 bushels ears, and it would average 100 bushels per acre, very sound corn. A light dressing of horse manure was given to part of it. The length of the three ears sent you is 38 1/2 inches; longest one 13 1/2 inches; number of kernels on the three, 2,324; on one, 810. These are not the largest nor longest ears, but very good. Variety planted, eight-rowed yellow, but may have got mixed with twelve, to produce the specimens.

This season I have been draining with tiles, a piece that I never before saw dry, and intend to put on corn another season. Drains 3 rods apart, and as deep as the fall will admit. To all inquiries as to whether "draining will pay," I answer yes, from 10 to 100 per cent—and if possible would drain one year in advance of the plow. Some tell me they would wait and see whether tiles will prove durable or not, before expending so much underground, but while they are waiting, my tiles will pay all expenses in extra products, and the farm be much improved. YOUNG FARMER. Wayne County, Oct., 1868.

REMARKS.—The above article is from the right source—for, though young, the writer is a reading, thinking and experimental cultivator, and destined to become, or indeed is already, both a practical and scientific farmer. The sample of corn sent us is one of the finest we have seen for years, and, in connection with the figures furnished as to yield, is proof positive of superiority in both quality and productiveness. The writer's experience in underdraining must prove satisfactory to himself and encouraging to others, and will do to read in connection with the able article of H. T. B., on our first page. As we believe the silver greys are not the only possessors or exponents of wisdom, we shall be glad to hear from many and many a young farmer in regard to matters upon which they can speak from personal observation and experience.

SORGHUM—SUBSOIL PLOW.

EDS. RURAL:—I am under obligations to an unknown Sorghum defender for a "Fidget Specific," in the shape of a Homeopathic vial of Sorghum Syrup, directions being as follows:—"One drop in a glass of water—take one teaspoonful water after each meal." It is certified, on the tiny label, that it "will keep anywhere north of Mason's and Dixon's line." Reasoning that if so small a dose would do good, a larger would do more, I at once swallowed one half of the sum total, amounting to several drops, which had no other effect than to leave a slight "pumpkin taste" in the mouth, which a little "weed" soon dispelled. Let me suggest to the donor, that an Allopathic prescription might work an effectual cure. But the sample is clear and translucent, equal no doubt to the distilled juice of sweet corn stalks or sugar beets—to which latter sweet-producing products I would also bespeak my friend's attention. The age of cheap sugar is evidently dawning in the distance! "T," who inquires for a certain "subsoil plow for ditching," is answered in the advertising column. Having no personal interest in the sale of the implement whatever, I may be allowed to say, that those heresabouts who have used it, speak enthusiastically in its praise. W. B. F. Prattsburgh, N. Y., 1868.

WHITE ATLERSBURY DUCKS.—Will any one inform me through the RURAL where I can obtain the White Atlersbury Duck?—R. B. S. Wethersfield, N. Y., Oct. 22, 1868.

Rural Miscellany.

TRANSACTIONS FOR 1867.—The Transactions of the N. Y. State Ag. Society for 1867 are already issued—quite an advance, in time, upon the publication of preceding volumes. An appropriate notice of the work—written by one of our contributors, after giving the volume a careful examination—has been received and will be published in a week or two.

FAST CORN HUSKING.—Under the head of "Rose against the World—Patent Corn Huskers in the Shade," our friend B. N. THOMAS, Esq., of Boas, Wayne Co., N. Y., sends us the following brief but very comprehensive and telling item:

"C. B. SHERMAN and three Boys, in 65 minutes, husked 40 bushels of Corn. Gao. SHERMAN, from 6 o'clock A. M. till 6 P. M., husked 100 bushels, on Monday last. B. F. SHERMAN, from 6 A. M. to 6 P. M., husked 100 bushels. GEORGE husked on Monday, and B. F. on Tuesday, only stopping to take their dinner in the field. Corn on the hill; stalks topped. The Corn from four rows thrown into one, and measured next day. If any person beats this, the Boys will try again."

NAPLES TOWN FAIR.—The people of Naples, Ontario Co., had a fine time at their recent Fair—an account of which was furnished us at the time, but which we were unable to give for want of space. "The entries were large, the exhibition fine in all departments, and the result a decided success," says our correspondent. The best breeds of Stock were well represented. Floral Hall was resplendent—comprising a large and superior display of Fruits, Flowers, Paintings, &c. "The Ladies' Department was fully represented—the wonders of the needle, and good taste, being displayed in every form of beauty and utility. An able, practical and appropriate address was delivered by Hon. R. B. VAN VALKENBURGH, of Bath—while the occasion was enlivened by popular airs from SUTTON'S BAND. It was truly a jubilant day for the farmers—a holiday of social intercourse and improvement—of useful information and instruction."

WISCONSIN STATE FAIR.—An intelligent friend at Palmyra, Wis., furnishes us an appreciative account of this Fair, which we condense as follows:

"Upon the whole our recent State Fair far surpassed anything of the kind before held in Wisconsin. The beautifully located grounds selected as the site upon this occasion for the great display of Agricultural and Mechanical productions, would do credit to any State. Situated only about one mile out of the pleasant city of Madison, and easy of access by railroad, the invitation was strong to the farmers to come, and they did come by thousands, and were well satisfied. I really believe that the people of Madison are a fair people, for I certainly heard have less grumbling about hard fare and accommodations than upon any former occasion of the kind. May they ever hereafter have all the fare they need. Once upon the ground, we beheld everything neatly arranged—a place for everything, and most things in their proper places—everything denoting that the officers were shrewd and efficient men. The show of Stock was good throughout; Machinery and Farming Implements, excellent. The exhibition of Fruit, especially of apples, was fully up to the expectations of the most sanguine. One exhibitor had twenty varieties of grapes. Some ten samples of Syrup from the Sugar Cane were on exhibition. The process of its manufacture was going on upon the Fair Ground, and there seemed to be more interest manifested in it than in any other one thing on exhibition. The show of Farm Products was such as to make the farmer proud of the State in which he lives. Everything seemed to pass off well, harmony apparently prevailing throughout the crowd of twenty-five thousand people."

THE POTATO TRADE OF TOLEDO, OHIO.—The Toledo Blade, in a recent article on the potato crop, states that the total number of bushels of potatoes shipped from Toledo, to the south and east, since the fall digging began, is about 26,000. Most of them were brought from the stations along the Michigan Southern Railroad, and the average cost per bushel has been 40 cents.

SORGHUM CIDER.—The Nashville (Tenn.) Homestead says that, besides the excellent syrup and sugar made from the Chinese Sugar Cane, there is yet another article obtained from it which is of pleasant taste, and doubtless healthy in its consequences. It is obtained by putting the expressed juice of the cane into any clean wood or glass vessel, allowing it to stand ten or twelve days, when it assumes the appearance of limpid water, and is fit for use. The flavor is similar to our best cider.

WOOL GROWING IN CALIFORNIA.—The San Francisco papers say that the wool business in California at the present day, is one of immense importance, and its steady and rapid increase promises to place it before long at the head of its articles of export. The Bulletin contends that California in a few years, will produce wool equal to the finest Australian, so desirable in the European markets. It is supposed by parties competent to judge, that the clip of the present year alone will reach a million and a quarter pounds.

THE CORN CROP IN KENTUCKY.—The Louisville Journal says the corn crop has never been so large in Kentucky as the present promises to be. We hear of fields in the Blue Grass regions estimated at 25 barrels, or 175 bushels to the acre, while fields promising 75 or 80 bushels are quite common.—Consequent upon this, droves of swine from the less prolific regions, cross the Ohio river daily at this and other points, to be fattened in Kentucky, and the indications now are that we shall have finer and fatter hogs this season than ever before.

We are indebted to various correspondents for interesting accounts of State, County and Town Fairs, several of which we have been unable to publish for want of space.

Orchard and Garden.

CAUSE OF THE CRACKING OF THE PEAR.

Most of our readers know that some varieties of pears in certain localities crack open before attaining maturity, and are very much injured or destroyed. A disease also affects the leaves of pear trees, called the leaf blight, and is supposed to be the same disease that causes the cracking of the fruit. For some years it has been thought by a good many that a fungus growth was the cause of the difficulty, though there had been but little investigation upon this point until about two years since, Prof. BRADLEY, one of the editors of the *London Gardener's Chronicle*, published in that journal the results of his researches, showing that the cracking of the pear, in many cases at least, was chargeable to a parasitic fungus.

At the meeting of the *Fruit Growers' Association of Western New York*, in September, 1887, the question—"What is the cause of the Cracking of the Pear and of the Leaf Blight (so called)?" was pretty fully discussed. Eight members took part in the debate. Messrs. TOWNSEND, BARRY, LANGWORTHY, SCOTT and THOMAS thought it was caused by a fungus; H. E. HOOKER and BRUCEMAN did not express an opinion as to the cause, and W. T. SMITH, had thought it the work of an insect, though he was not very confident. After the discussion was concluded a committee was appointed to investigate the subject and report at the next meeting, composed of the following gentlemen:—R. R. SCOTT, I. HEDRICK, W. T. SMITH, H. E. HOOKER, T. G. YOMANS, P. BARRY, L. E. BRUCEMAN. This being the action of the Convention we were very much surprised on receiving the last number of the *Gardener's Chronicle* to find the following as the leading article.

"Two years ago we stated in the *Gardener's Chronicle* that the cracking of Pears was, at least in many cases, due to the agency of *Helmithosporium dendriticum*, Wallr., a parasitic fungus, of a dark olive color, inclining to black; the same fungus which is so destructive to young trees, from attacking the leaves and half-ripened shoots. Our article attracted some notice in the United States, though it has been scoffed at by the practical men, who care for nothing save present profit, and was brought forward in the course of a discussion on cracking and leaf blight at a meeting of the Fruit Growers' Society of Western New York, held Sept. 18, 1887. We have accordingly had communications on the subject both during the past and present season from a very intelligent cultivator in the Genesee Valley Nurseries, Mr. R. Robinson Scott, formerly employed in the New Gardens, accompanied by several extracts from newspapers relative to the diseases to which Pear trees are subject in that country.

Mr. Scott speaking of the leaf-blight in one of his letters says, "I take the liberty of submitting to you one of the questions which has been introduced by fruit growers and pomologists in the United States, but upon which there has yet been no union of opinion, I mean the cause of what is known here as 'leaf blight,' which attacks the Pear tree, as well as the cause of the cracking and rust of the fruit. This malady has now become very extensive, and annually destroys a large portion of the pear crop. The pear seedlings in the seed beds are almost invariably attacked by it, and large numbers rendered valueless. The white Doyenne (or Virgule) has in some districts become entirely worthless from the cracking of its fruit, while in others it is the finest and most abundant bearer." At a late meeting of the Western New York Fruit Growers' Society, which numbers among its members several popular writers on vegetable physiology, of whom at least four were present, as the editor of Downing's *Fruit Trees of America*, and the authors of the *Fruit Garden and Fruit Calendar*, it was candidly stated that up to this time they had come to no conclusion as to the cause of the leaf-blight and cracking of the pear. I stated on your authority that it was caused by a fungus. This was not concurred in but laughed at by several members. I have since, however, repeated your statements founded upon examination, and moved for a committee to inquire into the matter, which, although opposed by the President of the Society as not likely to be of any utility, was at length carried. Mr. Scott still persists in his statement, and the notion has brought conviction to some good pear cultivators in England. We remain ourselves of the same opinion, and still recommend the use of those remedies which are found efficacious against fungi. In some cases it is probable that root pruning may be of use. The fungi which attack living leaves are generally more vigorous in proportion to the strength of the plant. It is a common saying amongst the raisers of Hawthorn Quick that they like to see mildew amongst it, because it shows that the plants are strong; and we may possibly profit by the notion in our treatment of leaf-blight. We have had no opportunity of trying sulphur in this malady, but it is right to state that experiments lately made in the case of the white Oldfield mildew of wheat, which is prevalent in May and June, have not been attended by any success, though we had satisfied ourselves that the sulphur used was of the right kind by microscopical examination. Not a thread seemed to be affected, and the mildew ran its course without any let or hindrance. It will not therefore do to generalize, or to say at once that sulphur will cure leaf blight, because it cures Grape mildew."

We have no objection to Mr. Scott's writing to Prof. BRADLEY; indeed we would not object to their getting up a *Mutual Esteem Society*, but we do hope when he writes again on American matters he will make statements with more care, for having attended the meetings of the Fruit Growers' Society, we can say most confidently the idea that the cracking of the pear was caused by a fungus was not "laughed at by several members." The opinion was treated with respect, when it was stated by Mr. B., and there was nothing in the action of the meeting, to show that it "was not concurred in," but the imagination of the writer. On this point we can procure the testimony of a score of witnesses. Neither was the appointment of a committee opposed by the President, unless our memory is unusually at fault, although, on the score of utility, it might well have been opposed. More than a year has now passed, and what information has been collected, what knowledge disseminated by this committee? How much worse off would pear cultivators have been, had this committee never been appointed?

Some of the remarks of the editor are equally objectionable. He would show more good sense by seeking the information contained in the public journals of this country, instead of depending upon the private letters of an individual for his knowledge of Horticultural matters in the United States. We would also recommend a little less self-conceit, and a good deal less contempt of practical men. This course would prevent the repetition of such untruthful and slanderous statements

as the following:—"Our article attracted some notice in the United States, though it has been scoffed at by the practical men who care for nothing save present profit."

THE SEASON.

Our first severe frost occurred on Monday night the 25th ult. Until that time Tomatoes, Dahlias and other tender plants, remained uninjured. Our Nurseries have done a large business this fall, the wood of the trees ripened early, the autumn weather has been quite favorable to out-door operations, and everything seems to have been sent away in excellent condition. If good care is taken of them, by their planters, we think few will complain of dead trees.

The present is the time to take precaution against the depredations of mice. On this subject we have given information needed, and only refer to it now lest it might be forgotten. Mice seldom are found in gardens in villages, but they are often very injurious to the farmers' garden as well as the orchard. In such places all mulching should be removed, and all refuse that would furnish them protection. Clean culture will make mice scarce. Bulbous Roots designed for flowering in the spring may yet be planted. This is the last chance you will have to secure for next spring a bed of *Tulips*, *Crocuses* or *Hyacinths*. Bulbs are cheap, and the most beautiful varieties can be easily obtained of the nurserymen and principal dealers in seeds.

Dahlias and all tender tubers and bulbs should now be taken up and stored away for the winter, where the frost cannot reach them, yet where the temperature will not be so high as to cause them to shrivel, or be forced into growth.

The fine weather of the present month affords an excellent opportunity for making all needed improvement in the garden, such as new walks, changing old ones, trenching, digging, fencin, &c. Where none of these permanent improvements are needed a good deal can be done in the way of cleaning and fixing up. Trees and plants may be put in to fill up vacancies until the ground freezes up. Indeed, we have done a good deal of improving and planted many trees during mild weather in December, and with good success. Mild weather at that time of the year, however, cannot be depended upon, so it is best to hurry up the work as fast as possible.

A PLEA FOR THE CAULIFLOWER.

Messrs. Editors:—I am prompted to resume the pen in behalf of the *Cauliflower*—a noble vegetable, and, therefore, a worthy cause to plead when we see it deteriorating in public estimation from some mysterious cause not yet explained. The vegetable venders any there is no call or sale for it in this market. Most it be assumed, then, that we, as a community, have a vitiated taste? or can it be a lack of knowledge in preparing it for the table, and thus the *chefs de cuisine* of our households share a portion of blame? or should it be attributed to the growers of this vegetable who supply our markets? True it is, that many growers in this vicinity are apparently indifferent to its proper cultivation, and frequently send it to market in a stunted, sickly state, and entirely void of bleaching, which of itself is almost an unpardonable error, as it tends to deprive it of an attractive feature peculiar to the cauliflower. It is but a few seasons since that a good head of cauliflower would command a high price and a ready market, but at the present time venders of vegetables object to it from the fact that it lays on their stands comparatively unnoticed and unsaleable, while cabbage, of whatever description, is eagerly sought after, and always realizes remunerative prices.

Now, it is not within my province to pronounce an exterminating edict upon any or all who may discard the cauliflower, through any imaginary cause, but I will intimate that a vegetable so superior to the cabbage both in flavor and attractiveness when properly cultivated should find encouragement from all. A cauliflower, like that of any other vegetable, should be properly cooked in order that its good qualities may be appreciated—over-cooked it becomes insipid—under-cooked it retains a rawness to which every other vegetable under similar circumstances, is liable. Properly cooked, it is a most palatable, wholesome, and nutritious diet, quite attractive, and free from that rankness which the cabbage too frequently possesses.

I conclude, then, by entreating growers to grow the cauliflower as it should be grown, and *cooks* to cook and serve it up as it should be done, and then we may expect to hear no more about cauliflowers being at a discount for "market purposes." As a cheering beacon to amateurs, epicureans, or connoisseurs who may entertain peculiar "notions" of their own in this direction, I may add that I have, the present season, with but little effort, grown cauliflowers a foot in diameter, and bleached them almost as white as "drifted snow"—perfect pictures in themselves, and requiring no "extra garnishings," when placed on the table. Three cheers I say for you, Mr. Editor, for first introducing the *Early Paris Cauliflower*. W. CREED.

Rochester, Oct., 1888.

REMARKS.—We endorse all that has been said in praise of this, the most delicious of all the vegetables of the cabbage family. Many of our gardeners take no pains in growing them, and some still sow seeds of kinds that will never form a good flower in this climate. The majority of the people in every city and village are not acquainted with their value, and they have never yet been grown to such an extent as to bring them within the means of all. We hope to see the time when they will be abundant in all of our markets, and reasonably cheap.

PRODUCTIVE GRAPE VINE.—Noticing a statement from a correspondent of the *RURAL*, a few weeks since, as to the productiveness of a grape vine, three years old, I take the liberty to send you the result of our experience. Three years last May, my father set a vine from the nursery, (*Isabella*) in a favorable situation, and tended it with care. The second year it bore a little; last year it was well loaded, and this year, from curiosity, we counted the clusters, and can report four hundred and forty-one of good size, with a fair prospect for their full maturity. — HOMER CRANDALL, *P. Express*, N. Y., Sept., 1888.

ACHIMENES ATROSANGUINEA.

PRESENTED by Messrs. Knight and Perry, under the above name.

This is a beautiful species, with the habit of *A. Skinneri*, but with slender flowers nearly an inch and a half long, with a yellow tube spotted with dull purple, and a vivid scarlet limb as bright as that of *Mimulus cardinalis*.

It is perfectly distinct from all other hitherto described, and ranks amongst the handsomest. — *London Horticultural Society's Journal*.

TREATMENT OF AN APPLE ORCHARD.—I would like to know whether it is best to work an apple orchard or to seed it down in grass. And if it is best to seed it, what kind of grass, the amount of seed to an acre? I would also like to know the best time to sow clover to enrich the ground, the quantity of seed, and the time to turn it under, so as to have the most profit from it. — YOUNG EGYPTIAN, *Elkhorn, Wash. Co., Ill.*, 1888.

REMARKS.—We would never put a young orchard down to grass. After an orchard becomes well established, grass may not injure it, but we would break it up every four or five years. Timothy or Orchard grass we should prefer to Blue grass, as they do not form so firm a turf. About six quarts of the former and a bushel and a half of the latter is required for seed. To obtain the best effect from clover, sow in the spring, pasture or mow the next summer, and the following spring turn under.

NEW ROCHELLE BLACKBERRIES.—Inquiries.—I have been thinking of setting out some of these blackberry plants so much talked about, and see if I can get the fruit. Does this *New Rochelle Blackberry* make wine? Will the berries sell readily in Rochester? Has any one in Rochester tried the making of wine? An answer through the *RURAL* will oblige.—JOS. HAWKINS, *Chili, Sept.*, 1888.

REMARKS.—There is no doubt but this fruit would make wine with the addition of sugar. The fruit has not been grown in this vicinity in large quantities, and we presume but little if any wine has been made. Blackberries of all kinds sell well here.

LARGE VEGETABLES.—Occasionally there appears in different papers, accounts of large vegetables, &c. Will you please give notice thro' the *RURAL* of the following, which we think very large. Mr. DANIEL LATTIN grew in his garden two blood beets which were perfect; one measured 24 inches in length, 23 inches in circumference, and weighed 12½ pounds, the other was 20 inches in circumference and weighed 6 pounds. From the potato field of E. GAZLEY, were dug two potatoes which weighed respectively 3½ and 4½ pounds. I know the above to be true and think them hard to beat. Please publish and oblige a subscriber.—J. M. LATTIN, *Hyde Park, Dutchess Co., N. Y.*

R. T. ALFORD, of Perinton, grew 21 pumpkins on one vine, weighing 329 pounds.

PEAR CULTURE IN CANADA.—I wish to make a few inquiries through the *RURAL*. 1. Will the finer varieties of pears succeed as far north as this latitude, 44 degrees? 2. Will the soil, which is a rather heavy clay, be suitable? 3. What varieties should I plant? I would like those that commence bearing early. 4. Which are the most profitable, standards or dwarfs? — WM. PRINGLE, *Markham, C. W.*

REMARKS.—Pears no doubt would succeed in your locality. Your soil if drained would be right for the pear, either on its own roots, or on quince stocks. A low, retentive clay soil is very unsuitable for fruit trees of all kinds. For varieties see list recommended by American Pomological Society, given in *RURAL* a few weeks ago. We would plant both dwarfs and standards.

INFORMATION WANTED.—Last spring I set a one year old *Rebecca* Grape vine, which has remained dormant the whole season. The old vine is about one foot long, and the lower half is still as green as ever. I would like to hear through the *RURAL*, as to the probability of its sprouting another year, as it sets in a valuable place for setting another vine.—NELSON HATCH, *Holley, N. Y.*, 1888.

REMARKS.—The vine, although making no growth, we presume from the above, retained its leaves through the season. If so, it most likely will take a start in the spring. If the soil was in good condition, the plant must have been very weak when set out.

PRESERVING ONION SETS.—Will you, or some of your correspondents, inform me through the columns of the *RURAL* how to keep Onion Sets, i. e. those that grow on the top of the stalk, through the winter? For two successive winters I have kept my "Sets" on a shelf just beneath the roof. The first time, they came out in the spring all right, but last winter every one was spoiled, owing to the frost, I suppose. I have a nice lot this fall, and would like to know the best mode of keeping them through the winter. — R. E. R., *Toledo, Ohio*.

BEST POTATOES FOR FAMILY USE.—(C. W. Erie, Pa.)—The best potatoes for baking are the *Merica*. They will often burst in the oven, like a chestnut, are exceedingly dry and fine flavored. They require a deal of care in boiling or they break in the water, and in this way become injured, and are better steamed than boiled. For boiling we prefer the *Marce* or the *Long Pink Eye*.

TRANSPLANTING TREES.

Messrs. Eds.:—There are few people who do not acknowledge the advantage derived from a right beginning in any kind of employment. Perhaps in no kind of business is this conceded fact so observable as in the transplanting of fruit trees, especially dwarf pears. Too much pains cannot be taken in the removal, and subsequent re-setting of the pear on the quince; for, if they become stunted the first year or two after transplanting, all subsequent good culture will hardly repair the loss sustained by carelessness in the beginning. I will give here my method of procedure, with its results, leaving your readers to judge for themselves whether my plan is the right one.

Early in the spring of the present year, I procured, of a responsible nurseryman, twenty-two dwarf pears, including nine different varieties, all adapted to growing on the quince root. Most of the trees were two years old from the bud, but, in order to get some particular kind, I was obliged to take those of only one year's growth. Before setting them out, I shortened in the tops about one-third, being sure to shape them as nearly as possible in a pyramidal form. I also cut off all the mutilated roots, of which there were too many, the persons who removed them having been very careless in the use of the spade. I then took a pail of water, and, with my trees, repaired to the fruit garden. The soil is a naturally drained sandy loam, having been well manured the previous year, and cropped with potatoes. I then took the spade and dug the holes two feet across, a foot deep, and eight feet apart in one single row. At the bottom of the holes, I found a kind of hard pan, which it was almost impossible to loosen with the spade, but I did loosen it, nevertheless, for I thought the spade would do it easier than the roots of my trees. I then took some of the surface soil and filled into the holes to within six inches of the top. I was now ready to proceed with the setting of the trees; not, however, until I had made a morlar of the water, which I had brought out, and some of the soil, then, before putting the trees in the hole, I gave the roots a good coating of the mud mixture. I exercised great care in putting the earth about the roots of the trees, that it might not crowd them out of their natural position. By putting them six inches below the surface, the stock of the pear was buried about two inches, which, I think, should always be done, as it adds to the longevity of the tree; for, in a few years, roots will spring out from the pear stock, and the tree will grow independent of the quince root.

After the ground was leveled off around the tree, I placed around each one, half a wheelbarrow of coarse straw manure, and then hauled a little earth on the top of this to keep it out of sight, and the wind from blowing it away. This was the finishing stroke, and all the attention they have since received, has been an occasional pinching of the side shoots, that they might not get the start of the leader. Every one of the trees lived through the summer, and have grown beyond all account. I have had a great many people to look at them, who are familiar with dwarf pear culture, and they say that they seldom, if ever, saw finer trees of their age. Certain am I that, for one, I am well pleased with the result, and feel that I am already paid for my trouble, in the great beauty and promising condition of my trees. At a future time I will write you with reference to the growing and bearing character of the different kinds of pear trees on the quince root.

Lyndonville, N. Y., 1888. M. L. PARKER.

INQUIRIES.—(Jane G., Lakeland, Min.)—Sow grape seed in the fall, in warm, mellow soil, but much better get vines of good hardy sorts from some nursery. Would plant trees in the spring in Minnesota; protect them during winter as recommended in a previous number. Peach trees are rendered dwarfish in their growth by being budded on the plum stock. By shortening in every spring the wood of the last year, the trees are kept in a compact form. No other form is as desirable as the pyramidal for dwarf pears.

SECOND CROP OF PEAS FROM THE SAME ROOTS.—J. B. PRATT, of Corning, N. Y., sends us several stalks of peas, bearing a second crop. He says, "I planted my peas in May, as usual, and eat them in July. The vines then died, but the old stalks revived, and we began to have the second picking from the 10th to the 15th of September." This is not uncommon in a damp situation or wet season. The second crop, however, is not worth the room occupied. A late sowing would be much better.

CHESTNUT TREES.—Will some correspondent of the *RURAL* be kind enough to give information respecting the growth of chestnut trees, the time of planting, and of transplanting, soil best adapted to their cultivation, &c.—FOREST CASTLE.

REMARKS.—The soil best adapted to the growth of chestnuts is a light dry sandy loam. On the time and manner of transplanting trees we have given "line upon line."

KOHL RABBI.—I received a paper of *Purple Kohl Rabi* seed from the Patent Office. The plants very much resemble cabbage, and are very large, but show no sign of heading. Can you tell me what I must do to make them head, or how they are to be used?—J. C. A.

REMARKS.—The turnip-like root is eaten, and not the leaves. They are prepared for the table like turnips.

AN INQUIRY.—Can you tell me what will prevent sheep and other animals from peeling young fruit trees?—J. D. C., *Cross Creek, Pa.*

REMARKS.—The best way is to keep them out of the orchard. Just the course you would pursue to prevent their injuring your parlor furniture.

RASPBERRY WINE.—We are indebted to H. H. DOOLITTLE, of Oaks Corners, N. Y., for samples of wine made from the American Black Raspberry. Mr. D. has published a pamphlet on his method of cultivating this native fruit.

TO CORRESPONDENTS.—Next week we hope to be able to give attention to the balance of delayed correspondence.

ABOUT DUMPLINGS.

The inquiry of "SYLVANUS" for "good dumplings"—whether the premium offered by him for the same has ought to do in the matter, we cannot say—has called forth a large number of replies. We cannot publish all—it were useless to do so, for, were he to comply with the terms by him offered, he would have a life labor in "putting on his cap and dropping in to see the fair compounders" of this delicacy. Those who miss their recipes—and their chance in competing for a husband—may solace themselves that there are a vast number in like position to SYLVANUS; that "there is as good a fish in the sea as ever was caught," and that, if they make as good a display in the kitchen as they do in the Domestic Department of the *RURAL*, they possess just the bait for eager bachelors to bite at.

Eds. *RURAL*:—I notice in your paper of October 10th, "A Chance for Girls," and, as I happen to have a recipe for "Apple Dumplings" which we call good, I send it forthwith, hoping "SYLVANUS" landlady" will do it justice. Three tumblers flour; a piece of butter the size of a walnut; one tablespoonful of cream tartar, both thoroughly rubbed in the flour; half tablespoonful soda, dissolved in one tumbler of sweet milk. To be put in clean cloths, tied loosely, and boiled or steamed half an hour.—JENNIE, *Chemango Co., N. Y.*, 1888.

NOTICING the inquiry of SYLVANUS for a recipe for good light dumplings, I send him my mode of making them, which never fails. Pare and slice potatoes very thin, boil them very soft in water sufficient to mix the dough with, skim out the potatoes and mash fine—stirring a little flour in while scalding hot—then pour the water, in which they were boiled, upon the mixture, stirring well, set it to cool for the emptying, let it rise, set in a cool place for some time—it will be better if left for twelve hours—then make into a dough. It wants no shortening or soda, and it never fails. Let the dough stand until light, then make up. If, after trying, B. does not pronounce them good, I shall set him down as an "Old Bach."—JENNIE, *Rose Glen, Aurora, N. Y.*, 1888.

MR. SYLVANUS:—Please doff your cap, for I think I have the recipe you want. Take one pint butter-milk or sour milk; a teaspoonful saleratus; half a teaspoonful of salt; and a teaspoonful of fruit, either dried or green. Mix just hard enough so that it will not stick to the board. Roll out, put in a deep pie tin, place the tin in a steamer over a kettle of water, and boil an hour and a half. For apple dumplings, mix the dough without fruit, fill the tin with apples (not whole, but peeled and cored), placing the crust on top, and boil as above directed. If you have a good landlady, she will know how to serve when done, if not, I will wait upon you, with pleasure, if you will come and dine with —MOLLY, on the Hillside.

HAVING noticed an article in a late number of *RURAL*, from "SYLVANUS," requesting some young lady to send a recipe for making "good light dumplings, of apples, cherries, grapes, &c.," I thought I would give one a relative—a cousin to apple dumplings—which I think he will like much better. But in case his landlady fails to have good success, we will promise to have one in readiness for him, when he calls upon us, and we are sure he will like it so well that he will call again. Here it is:—Pare, core and quarter twelve tart apples, put them in a pan, pour on a half teacup molasses and as much water; season with cinnamon. Then make a crust of sour cream and soda, and cover the apples with it. Put it on the stove, cover it tight, and steam until done.

Sauce for Same.—Two teaspoons sugar; a heaping tablespoon flour; a small piece of butter—stir thoroughly; pour on boiling water and cook well, a little nutmeg.—M. Elbridge, *Onondaga Co., N. Y.*

SOME dumplings SYLVANUS, of Bartown, must have. A recipe for his landlady I forthwith give. Take apples that are sour and two quarts of flour. Scald the flour. Wrap the apples in dough. When the water is boiling, drop the dumplings in and let them boil one hour. Serve up with sauce that is best to your liking.

Take one pint of buttermilk; a piece of butter the size of an egg; one teaspoonful of soda, and enough flour to form a stiff paste; stew the cherries or grapes, roll the dough, and spread the fruit thinly on its surface—roll the paste so that there will be alternate layers of fruit and paste. Have ready a kettle of boiling water, wrap the dumpling in a cloth and boil it an hour. When served it should be eat in slices, and eaten with any sauce that may be preferred. We hope the dumplings will prove good. SYLVANUS has our sympathy in having only the interest of a housekeeper in his dumplings.—ANNA & AGNES, *Phelps, N. Y.*, 1888.

COLORING RECIPE—PICKLING APPLES, &c.

As the Corner, devoted to "Domestic Economy," is one in which all housekeepers must feel an interest, especially if they are young and inexperienced, I would add my mite, particularly as one has asked information regarding.

PRESERVING CITRONS.—Cut them in slices, pare them, then cut in whatever shape you like—fancy or plain. Weigh, and allow a pound of good white sugar to a pound of citron. Boil your citron in alum water until tender, then skim them out, add your sugar, and, to eight pounds, allow two lemons, nicely cut, then boil them fifteen or twenty minutes. Skim out the fruit and let the syrup boil awhile longer, but not too much. The lemons should be boiled in water enough to well-cover them while the citron is boiled in alum water.

TO COLOR STRAW COLOR.—White clover blossoms will color a beautiful straw color, whether any setting is necessary or not, I do not know, but judge a little alum would be good.

GINGER SNAPS, EXTRA.—One cup molasses; 1 do. sugar; 1 do. butter; part teacup of water with a very little saleratus.

PICKLING APPLES.—Take not over-large sweet apples, pare them, then in each one put a few cloves. To ten pounds of apples allow three pounds of sugar, a pint and a half of vinegar and spices, tied up in a cloth—cloves and cinnamon. Boil the apples until tender, taking them out as they become so, boil your syrup but a little longer, then turn over them. If you have no peaches, as we in Allegheny have not, you will find these excellent, or I am mistaken.

"MAMA IS DEAD."

Death's angel hovered o'er a home
And bore, in his embrace,
A mother from her little ones,
And strangers filled her place.
Her little boy, but four years old,
Came to my side and said,
With wonder in his bright dark eye,
"Did you know mama is dead?"

He knew not on his future life
A shadow dark was thrown,
In coming years a mother's hand
Would never clasp his own.
His childish mind could not take in
That wonder deep and dread,
But still his little voice was heard,
"Did you know mama is dead?"

Ah, little one, in after years
When sorrows on these crow's,
And thy young head with weight of years
And deeper grief is bowed;
Thou'lt think of one whose gentle hand
Should press thy aching head;
And then the weary thought will come,
Alas! my Mother's dead.

Little Valley, N. Y., 1858.

THE TWO BRIDALS.

HETTY GREY was to be married. Sweet HETTY, who lived in the cottage by the wood, with the neatly arranged garden in front. Here were her flowers, freed from all intrusion of weeds—there the grape-vine displayed its broad green leaves and juicy clusters; while the woodbine almost concealed the little brown cottage, fairly kissing its low mossy eaves. Sometimes the gentle zephyr would lift its closely woven leaves, and allow the sun's golden beams to peep at the neatness and order within, or perhaps amble upon its fair occupants. Here HETTY lived amid the beauties of nature. She sought not brilliant company; but, retired, as it were, from the bustling world, talked to the flowers, worked with the bees, and caroled with the birds. HETTY was not beautiful, no glossy ringlets waved over her fair white neck, but her soft brown hair was combed smoothly back with all the simplicity of a quakeress. Her eyes were neither dark nor lustrous, nor were her teeth admired for their pearly whiteness. Yet, wearing continually the "ornament of a meek and quiet spirit," we loved her.

And she must leave us—must leave her flowers and well trained vines—her favorite seat by the brookside, and all the bright halcyon spots, sacred to the memory of her youth, for Squire PERRY would soon take her, as his bride, to his own noble mansion, where she would live like an Empress, and reign like a queen. Every one said it would be a great change to HETTY.

Well, the time came, and with the bridal veil floating above her head, and the orange wreath trembling on her pale brow, she went from us.

Days, weeks, and months—lonely and dreary months—passed, and I witnessed another bridal in the cottage. HETTY lay quietly with her waxen hands folded on her breast. The orange wreath had long been withered, and now the glossy myrtle was woven with her brown hair. Stray sunbeams stole through the open window and lighted up her calm face with happy smiles. And now there was no joyousness—no merry laugh, or hearty greeting—no "smiles and kisses"—naught but solemn tones, breathless whispers, and soft muffled steps—naught but sighs and tears, for HETTY was "wedded unto death." Her great change had come.

OMEGA.

Written for Moore's Rural New-Yorker
MOTHER.

WHAT a world of meaning in this simple word. How it turns the mind back to scenes of other days—the days of happy childhood. Ah, those sunny hours! Fain would I recall them, but they are gone and forever. Like an oasis in the desert, memory recalls the past, and it breaks up the fountain of love, mingled with sorrow, down deep in our hearts, and we are children again. It seems but yesterday that we were little playful children, with hearts as free and pure as the air we breathe. The care of the world did not annoy us; but, happy as the birds that soar in the blue ether, we thought not, neither cared for the future. It was then we had the counsels and admonitions of a mother. Then, when we were weary with play, would she gather us around her, and tell of a Savior who came upon the earth to suffer and die for us, till our sympathies were enlisted, and the tears would course down our cheeks—our little hearts well nigh bursting with grief, as we sobbed ourselves to sleep on her bosom.

In after years have we sat and listened from those same lips—as in years before, when she sang to us our first lullaby song, or cradled us on her bosom,—to the story of the Cross, and of the final triumph of Him who came to redeem a world from sin.

A Mother! Sweetest name on earth. Where can we pour out our sorrows so well, as on a mother's faithful breast? What a confiding trust we repose in that calm, serene countenance, and what love a mother has for us. How many tender recollections crowd themselves upon our memory, as we recall the fond love of a mother. Have not your hearts sometimes been saddened by the coolness of some friend you had confided in? and does not memory bring back sometimes in your life when your heart has been chilled by the cold waters of indifference, coming from a source where you had been wont to receive the gentle dews of affection? If so, have you not found in a Mother's love the balm of your wounded spirits? When the world looks cold and cheerless, and the rough blasts of disappointment beat rudely against our hearts, where can we go to share the tear of sympathy with such confidence as to a Mother? When sickness rests upon us, and lays us prostrate upon a bed of suffering, who, like a Mother, can bathe our aching brow, and with unwearied diligence supply our every want? Her love changeth not. It is ever the same, let fortune smile or frown. When the poor, misguided youth, who has left the home of his childhood, and wandered upon the

broad sea of vice and iniquity, sees in the distance a star that lures him back to the harbor of safety, what is it but a Mother's love. She is like a beacon light to the wanderer, to bring him back to the fold of safety and love. Have any of you been deprived of such a friend? If an "All Wise Providence" has removed a Mother from your circle, have you not now stronger ties to bind you to that world where that loved Mother has gone?

Four years have passed away since I gazed on the pale face and sunken eye of a loved Mother. It was a bright morning in early summer, when the air was perfumed with the breath of flowers, and the birds caroled their sweetest notes the live long day, that we imprinted the last kiss upon her marble brow, and she was buried from our sight, in the earth's green bosom. How we love to visit the spot where lies the dust of that now sainted one; for it is there the attractions of earth fade into nothingness, and we long to die and be laid by her side.

"Hillside Cottage," N. Y., 1859.

Written for Moore's Rural New-Yorker
SUNSET FANCIES.

'Tis the hour of twilight—a beautiful calm summer twilight. I have sought a retired spot to muse with nature on the grandeur of the slowly fading day. I watch the sun, as step by step he leaves the earth—no disagreeable noise grates upon the ear as he makes his exit, but slowly and silently he goes, and I almost fancy I see him enter the portals of Heaven. The shadows grow longer and longer—the birds chirp for him a farewell song—the dew bows her lovely head and weeps—and night silently throws her sable mantle over us and soon she will hold undisputed sway.

Sitting beneath an aged oak, whose wide-spreading branches are reflected in the clear waters of a babbling brook, I thought how befitting such an hour to spend alone with memory. Not to reflect upon the past, dwelling only upon its sorrows, but to give them—the dark spots in the picture—a passing glance, and calling up life's joys. There are some who are not content with having passed through sorrows once, but they must think of them—and in imagination live them all over again, thus making life doubly sorrowful and memory's mirror an unpleasant thing to reflect upon. Yes, we would look upon the joys of life, our happy hours of childhood and the very many happy hours we have spent since, and thank God it was not all a dark picture. We would gather up the jewels lost, but are there not rare jewels in store for us in the future? Let us in fancy visit the fair climes of futurity, wreathing for ourselves a bright hereafter, dwelling not upon the sorrows that may come, but rather let us look forward to the joys that will be attained. Let us remember our present joys are only a foretaste of the perfect joy that is in store for us in the future, and also

"Earth has no sorrows that Heaven cannot heal."

While we have been watching the departure of the day and musing upon its beauties, twilight has deepened into night and LUNA—the pale goddess—with her retinue of glittering stars, has made her appearance proudly driving her shining chariot across the azure vault as if anxious to compensate in some measure for the absence of her superior—the sun. How beautiful now the scene. Sitting on a mossy sod in the moon's pale light, with so much that is lovely to admire, I tho't there no lesson to be learned from such a scene as this? I fancied I heard a voice whisper in cadence low, "Ye, thou mayest learn one lesson. If earth is so lovely how superbly magnificent must Heaven be." Yes, the beauties of the two can no more be compared, each with the other, than the lustre of a diadem resting upon the brow of an earthly potentate can be compared with the glory that surrounds the head of our Celestial King.

Brookport, N. Y., 1858.

LUNA.

HOW TRUE!

"There is in every human being a craving for home felt pleasures, a desire for daily communion and interchange of affection with some kindred spirit, who feels more interested in our thoughts and feelings than all the world beside, and for this, the wide, wide Universe offers no substitute;" yet how few are fitted, by education, habits, and principles, to enjoy conjugal happiness!—and how many do not consider that in choosing a partner for life, rational and durable enjoyment can only be expected, with a person of suitable age, similarity of tastes and abilities; of virtuous principles, and of good understanding. They are captivated with a pretty face, agreeable person, and winning manners, or what is equally common in modern days, with the shining qualities of the purse; tender looks, and tales of first love, (which is often only first folly); are exchanged; they fancy they are in love, and rush into matrimony, like the horse into battle, and find out, when it is too late, that the alken bands of wedlock are iron bands, fastened with arrows of steel, that give the sharpest wound! After a short acquaintance, they become weary of each other. The force of beauty and passion is exhausted, and glittering gold appears, like miry clay, but a clog to the enjoyments of those who travel on this perilous road to conjugal felicity.

SIMPLICITY OF DRESS.—Female loveliness never appears to so good advantage as when set off with simplicity of dress. No artist ever decks his angels with towering feathers and gaudy jewelry; and our dear human angels, if they would make good their title to that name, should carefully avoid ornaments which properly belong to Indian squaws and African princes. These trinkets may serve to give effect on the stage or upon a ball-room floor, but in daily life there is no substitute for the charm of simplicity. A vulgar taste is not to be disguised by gold and diamonds. The absence of a true taste and refinement of delicacy, cannot be compensated for by the possession of the most princely fortune. Mind measures gold, but gold cannot measure mind. Through dress the mind may be read, as through the delicate tints, the lettered page. A modest woman will dress modestly, and a really refined and intellectual woman will wear the marks of careful selection and fastidious taste.

Be thrifty to yourself, that you may be liberal to others.

Choice Miscellany.

Written for Moore's Rural New-Yorker
"ALL'S NOT GOLD THAT GLITTERS."

Thou'rt o'er the bright features the warm sunny smile
May tell of a gladness within,
Yet oft the gay surface but covers the gloom
That springs from the impulse of sin;
And the heart that is gay in pleasure's wild chase,
Though beauty and wit sparkle there,
Too often in sorrow will seek some lone place,
To breathe the sad tones of despair.

I've stood on the shore when Ontario's wave,
Like an infant, seemed taking its sleep,
And the ripple of light o'er its smooth waters gave
A fairy-like charm to the deep;
But though o'er its surface both crimson and gold
Seemed wafted by zephyr's warm breath,
Yet deep 'neath its waters, all silent and cold,
The mariner slumbered in death.

I've seen the gay dawning of hope's cheering light,
In the morning of life's early day;
But ere the glad spirit could seize the delight,
Like the snow-wreath, it faded away;
And the mystical clasp of the golden-wrought chain,
Which friendship entwined round the heart,
Though fair to the eye, was broken in twain,
And its links, one by one, fell apart.

They tell of a clime in which happiness dwells,
Unmarred by the presence of sin;
Where the smile on the brow is the index that tells,
Of the purity reigning within—
Where love scatters light, like a balm from her wing,
Awaking new life in the soul,
And fidelity strengthens those graces that bring
The attainment of life's cherished goal.
Ah yes! it shall be when the future hath rolled
The mists of dark ages away,
All those blessings now hidden at once shall unfold
In the light of millennial day.
Somerset, N. Y., 1858.

CASUAL THOUGHTS AND FANCIES.—No. I.

BRIVITY.—Many persons dilute their thoughts till they lose much of their strength and value—a good idea is often expanded into an article which is never read, when it might have been clearly and strongly expressed in a few lines.

EXERCISE ESSENTIAL TO PLEASURE.—A man's greatest happiness results, not so much from the possession of desired objects, as from the effort which he must make to obtain them. If a man should have every want supplied without an effort, he would be perfectly miserable, for no new want could call forth renewed exertion. Truly, "a man's life or happiness consisteth not so much in the abundance of things that he hath," but rather in the abundance of things that he hath not and for which he may labor and hope. Perfect success, as well as despair, might render a man unhappy, for both destroy hope, and thus take away all incentive to exertion. It was meet that ALEXANDER should weep when the world was under his sway, for the limit of his selfish ambition had been reached, and nothing remained to him but quietly to enjoy his past achievements—a condition which must ever preclude the possibility of all enjoyment.

GREATNESS.—True nobility of character is not an accident nor the result of some one peculiar faculty which the great alone possess—but it is the higher and truer development of those powers which all men have in a greater or less degree. So that true manliness is not a gift to be merely wished for, but is a work to be performed—something to be wrought out by the man himself, with much hard labor and patient toil.

FRIENDSHIP.—Some persons strive to make others their friends by a multitude of favors, and then think them very ungrateful if they will not admit them to their friendship. Such persons forget that friendship is the result, not of gratitude, but of congeniality of spirit. It is based on equalities, and shuns all idea of dependence or obligation. And so, if these little courtesies of common life are remembered as debts due from one to the other, they make debtors and creditors instead of friends.

OSTENTATIOUS SERVICES.—The true gentleman ever strives to hide or to depreciate his services, in order to remove all idea of dependence or obligation which is so galling to the sensitive mind. He is ever seeking to show that his favors to you have cost him no trouble, or have been to his positive advantage. He is like the Irishman at the well, who, with one pail of water in his hand, offered to convey another for a little boy who was tugging it along, though scarcely able to lift it. When the boy said he was afraid it would be too much trouble, PAT replied,—"Och, be alay about the trouble. It's no trouble at all, at all. It's easier to take the both than the one, for one just balances the other." This is the highest example of true politeness. The favor was not only performed, but it was done in such a way as to remove all idea of indebtedness. Some persons would have done the same act, but would make the load of debt heavier than a dozen pails of water. PAT was a gentleman, and such let all men be.

Henrietta, N. Y., 1858.

HAPPINESS, TRUE AND FALSE.—True happiness is of a retired nature, and an enemy to pomp and noise; it arises in the first place, from the enjoyment of one's self, and in the next, from the friendship and conversation of a few select companions; it loves shade and solitude, and naturally haunts groves and fountains, fields and meadows; in short, it feels everything it wants within itself, and receives no addition from multitudes of witnesses and spectators. On the contrary, false happiness loves to be in a crowd, and to draw the eyes of the world upon her. She does not receive any satisfaction from the applause which she gives herself, but from the admiration which she raises in others. She flourishes in courts and palaces, theatres and assemblies, and has no existence but when she is looked upon.—Adrian.

A THOUSAND acts of thought, and will, and deed, shape the features and expression of the soul—habits of love, and purity, and truth—habits of falsehood, malice, and uncleanness—silently mould and fashion it, till at length it wears the likeness of God, or the image and superscription of the Evil One.

Written for Moore's Rural New-Yorker
LINGERINGS WITH NATURE.—NO. II.

AVON SPRINGS.

AVON SPRINGS! A vision of rest for the weary,
peace for the tortured, and renovation for the afflicted! A dawning of new hopes, and a refreshing of olden memories! A dream of loving ease, pleasant thoughts, and merry companions!

Who can resist the magic of sunny skies, happy faces, and pleasant surroundings? Not the desponding invalid who sits upon the long piazzas, in the dewy morning, with a placid smile and hopeful glance for each passing pleasure seeker. Not sweet children who gambol on the green sward, unrestrained; nor the fair girls who trip lightly over the rural walks, and quietly laugh at the love-born maidens and their stricken LEANDESS, who promenade unconsciously through the shaded avenues.

A breath of rest, ease, and freedom seems wafted upon the morning breeze, and muscles long used to labor lose their tension—bears attuned to stormy sorrow feel calmness stealing upon them—minds jaded with the monotonous haste of business, catch sweet glimpses of their younger and better selves in the prattling voices about them; while those high and holy souls, to whom thought is a joy, retire within, and gaze in silent rapture upon the graceful mingling of beautiful forms, waving shadows and sparkling fountains. The soiled and morbid traveler here shakes the dust from his garments and thoughts—the care-worn housewife forgets her anxieties and relaxes to her early dream. Heavy eyes are brighter—wrinkled and stolid faces are lightened at sight of the various phases of life which this mixed society displays.

As the sun grows warm the rustic seats and grass-paved walks are deserted, and the groups about the fountains, with their wry faces and laughing chat, grow smaller until they are reduced to a few parties from the country, whose hearty mirth and vociferous cheer jars upon the still noon-day quiet. As the shades lengthen, the gay swarms appear, riding and promenading with renewed zest. The graceful morning costumes, so chaste and simple, have given place to the gaudy hues and floating draperies which bespeak gayety and fashion, and, as evening comes, the moonlight drives the inspiring music and bewitching dance give no memories of the rural morning scene.

Like the Summer Sabbath to the work day world, is the soothing influence of sweet Avon to the crowd weary and business-worn, who seek health and pleasure in this quiet retreat. It is happiness unpeasable, that, in the order of Providence, some beautiful resorts are saved from the giant strides of speculation and the mouldering breath of decay, where spirit-sighs may wanton with the still night-air, and poet-hearts beat high and fast in the frequented solitude. It is there that the gentle grow vivacious—the timid, brave—the boisterous, subdued—the trifling, thoughtful—the seared, sensitive—the pious, holy. These are the oases—spots, green and fresh, consecrated to repose and re-vivification; where the healing waters flow, and the balmy air is laden with hope-giving health and active inspiration.

Avon, the incomparable, the never-forgotten;—splendor and power may find loftier halls, more magnificent views and Nature's grander moods, but none more than thou wilt linger as a sweet memory, stealing into the heart like a silent joy, soothing, as the gentle hand of love to the aching head and fevered brow.
L. A. T.
North Fairfield, O., 1858.

THE YOUNG MAN'S LEISURE.

YOUNG MAN! after the duties of the day are over, how do you spend your evenings? When business is dull, and leaves, at your disposal, many unoccupied hours, what disposition do you make of them? I have known, and now know, many young men, who, if they devoted to any scientific, or literary, or professional pursuits, the time they spend in games of chance, and lounging in bed, might rise to any eminence. You have all read of the sexton's son, who became a fine astronomer by spending a short time every evening in gazing at the stars, after ringing the bell for nine o'clock. Sir William Phipps, who, at the age of forty five, had attained the order of knighthood, and the office of High Sheriff of New England, and Governor of Massachusetts, learned to read and write, after his eighteenth year, of a ship carpenter, in Boston. William Gifford, the great editor of the Quarterly, was an apprentice to a shoemaker, and spent his leisure hours in study. And because he had neither pen nor paper, slate nor pencil, he wrought out his problems on smooth leather with a blunt awl.

David Rittenhouse, the American astronomer, when a plow-boy, was observed to have covered his plow and fences with figures and calculations. James Ferguson, the Scotch astronomer, learned to read by himself and mastered the elements of astronomy while a shepherd's boy in the fields by night. And perhaps it is not too much to say that, if the hours wasted in idle company, in vain conversation at the tavern, were only spent in the pursuit of useful knowledge, the duldest apprentice in any of our shops might become an intelligent member of society, and a fit person for most of our civil offices. By such a course, the rough covering of many a youth is laid aside; and their ideas, instead of being confined to local subjects and technicalities, might range the wide fields of creation; and other stars from among the young men of this city might be added to the list of worthies that are gilding our country with bright yet mellow light.—Rev. Dr. Murray.

THE INWARD MONITOR.

A MAN in his judgment may be blinded by the path of duty unable to see:
But there is an inward monitor near,
Whose whispers rise from the heart to the ear,
And if that monitor he will obey,
From the path of right he'll not go astray.

True courage is the result of reasoning. A brave mind is always impregnable. Resolution lies more in the head than in the veins, and a just sense of honor and infamy, of duty and of religion, will carry us farther than all the force of mechanism.

'Tis a miserable thing to live in suspense; it is the life of a spider.

Sabbath Musings.

Written for Moore's Rural New-Yorker
VOICES WITHIN.

BY C. C. BRADDOCK.

O, THERE are stormy strife of pain
That clash around the human soul,
When time, with all its wealth and fame,
Seems but an empty, joyless whole.

Then yearning voices rise within
That tell us of another age,
Beyond this restless life of sin,
Where jarring discords do not rage.

And then a calmness gathers o'er
Our feelings of oppressive gloom,
And light and beauty rise before,
And gild the Gateway of the Tomb.

We feel that 'tis not well to sigh,
And yield to hopelessness and dread,
For when we die, we do not die—
We are not dead, when we are dead.

We feel, if we are good and true,
That storm and strife shall pass away,
And then our spirit shall renew
The strength and joy they lose to-day.

These inner voices whisper this—
Whisper, "if man is rightly wise,
Immortal life and perfect bliss
Await him when we say he dies."

Written for Moore's Rural New-Yorker

THE DAY BOOK.

EVERY soul that is born into this world is like a blank book, having its pages of virgin white. Every thought, and act, and deed is written upon that soul with fearful accuracy, and durability. Each day has assigned to it its bright page either to be filled with a neatly arranged record of virtuous thoughts and actions, or to be scrawled and blotted over with sins, stains and vices.

God has given us a memory by which we are enabled to turn back the leaves of the book, and look over our past life, and take lessons and warnings by experience; and though we cannot bring to recollection every thought or deed of our life, yet they exist, indelibly engraved on the tablet of time, and will, at some time stare us fearfully in the face.

Oh, how happy is the condition of that soul who can turn back the leaves of memory, until he comes to the page where the Savior has written, "Thy sins are forgiven thee." What a difference between the pages following this and those preceding it! His "sins are blotted out," and his transgressions are remembered no more. Thenceforth are "all things done decently, and in order."

There is also a Great Book in Heaven. An angel stands by it, and whenever a sinner in this world turns to Christ, in truth and sincerity, fully endowed with faith unto salvation, with obedience to the will of Heaven, his name is written in the Book of Life, and all the holy angels rejoice at the baptism in the "blood that cleanses from every stain."

Williamsville, N. Y., Oct., 1858.

T. W.

FRESHNESS OF THE BIBLE.

THE learned Le Clerc tells us, that while he was compiling his Harmony, he was so struck with admiration of the excellent discourse of Jesus, and so inflamed with the love of his most holy doctrine, that he thought he had then but just begun to be acquainted with what he had scarcely ever laid out of his hands from his infancy.

Queen Elizabeth, who spent much of her time in reading the best writings of her own and former ages, has left on record the following:—"I walk many times in the pleasant fields of the Holy Scriptures, where I pluck the goodly herbs of sentences by pruning, eat them by reading, digest them by musing, and lay them up at length in the high seat of memory by gathering them together, so that, having tasted their sweetness, I may less perceive the bitterness of life."

During the time that Dr. Kennicott was employed on his Polyglott Bible, it was the constant office of his wife, in their daily sittings, to read to him those different portions to which his immediate attention was called. When preparing for their ride, the day after his great work was completed, upon her asking him what book she should take, "O," said he, "let us begin the Bible."—Primitive Church Magazine.

PROMISES.—The following sentences from the pen of William Gurnall, deserve much pondering; they will raise a vital question in the mind of those who have never felt the sweetness of the promises in the hour of need:—"Promises are like the clothes we wear. If there be heat in the body to warm them, they warm us; but if there be none, they give none. So where there is living faith, the promise will afford warm comfort; but on a dead, unbelieving heart, it lies cold and ineffectual; it has no more effect than pouring a cordial down the throat of a corpse. Again, the promises do not throw out comfort as fire throws out heat; for then we should only need to go to them in order to be warmed: their heat is like the fire in the flint, which must be struck out by force, and this force can only be applied by faith."

THE WAY AND THE TRUTH.—O, Lord, who art the light, the way, the truth, the life; in whom there is no darkness, error, vanity, nor death: the light, without which there is error; the life, without which there is death; say, Lord, let there be light, and I shall see light, and eschew darkness; I shall see the way, and avoid wandering; I shall see the truth, and shun error; I shall see life and escape death; illuminate, O, illuminate my blind soul, which sitteth in darkness, and the shadow of death; and direct my feet in the way of peace.—Augustine.

THE SHADOW OF GOD'S WING.—Lord, let my soul flee from the scorching thoughts of the world under the cover of thy wings, that, being refreshed by the moderation of thy shadow, we may sing merrily. In peace will I lay me down and rest.—Augustine.

The faults of the world can only be learned by a long acquaintance with it and by suffering from that acquaintance.

The Educator.

Written for Moore's Rural New-Yorker.

"PERSEVERANTIA VINCIT OMNIA."

This good old Latin exaggeration, so much relied on by teachers and leaders to stimulate the industry and ambition of their pupils and followers, besides helping to effect a great deal of good, has contributed towards accomplishing a vast amount of mischief. It has been the encouragement and the excuse of thousands of young persons, who, dazzled by the brilliant career of certain masters in their professions, have applied their time and energies to pursuits for which they were conscious they had but little natural aptitude, in the fond persuasion that equal success might be realized by themselves if the single condition implied in the above inspiring motto were faithfully observed.

"Perseverance conquers all things," says a young man to himself, after listening to an eloquent discourse by the Rev. Dr. So-and-so. "It has made of the speaker before me one of the first divines in the country,—why may it not do as much for me? I have abundant energy to carry me through the necessary preparation; I would gladly assume the cares and trials incident to the ministerial profession, if thereby I might assist in the great work of a world's reformation; and in any way I lack fitness, those ennobling words 'Perseverantia Vincit Omnia,' that have helped me through many a hard task, give assurance that patient industry will supply all deficiencies. Yes, I will be a preacher!" Accordingly, he enters on the work of preparation,—he studies hard,—he strives to gather all the graces of ancient and modern literature to embellish his style, and he assiduously cultivates the art of oratory to lend persuasion to his speech,—he passes a triumphant examination, obtains a charge, undergoes the usual ceremonies of ordination, and commences the career of a Minister of the Gospel. For a time, no doubt, he is well pleased with the life he has chosen—he sees that he is improving—the preparation of his sermons costs him less time and labor than at first; they are besides of better quality, and he receives plenty of fair words from his hearers. But, by-and-by, when he comes to look about for the results of his preaching, the chances are that he finds but little to encourage him. It is small satisfaction to him to hear his praise from the lips of his parishioners,—he seeks rather to read it in their lives—and if any perceptible good effect of his efforts exists there, it is so insignificant, compared with what he promised himself, that discontent begins to creep into his soul. Unwilling to believe the fault lies in himself, he meditates a change of location; he will try what a difference in his latitude or longitude will do for him; he goes West, perhaps. But he takes the old self with him, and human nature is the same everywhere. After dragging through some sad, discouraging years, conscience rouses him to a rigid self-examination; he looks searching within, and he sees that the preacher's heart is not in him—that Nature denied him the advantages of a reformer—and he no longer feels justified in pursuing the vocation of a preacher. He will betake himself to some manual employment; for there he is sure of being able to accomplish a greater or less amount of good. He has found that perseverance does not conquer all things.

If we could know how many of the persons who yearly enter the professions do so with little regard to any special fitness for the pursuits they choose, but are attracted to them by mere fancy—supported by faith in the power of patient study to make good all defects; doubtless the knowledge would surprise us. The far greater proportional number who abandon the professions for agriculture and mechanical employments, than leave manual occupations for law, medicine, &c., indicate plainly enough, that the young understand the above motto as having reference to professional life—as pointing to intellectual rather than physical triumphs.

Now, endeavor, so it be towards something useful, is always worthy of respect. We may smile at the efforts of a man striving after something far beyond his reach, or we may regard with pity him, who, to our view, wastes his talent by directing it to an inferior pursuit; but, still, there is always something about even misapplied effort that commands respect. So long as a man works at something—so long as he tries to better his own or others' condition, physical or spiritual, there is hope of him. Yet, it is by no means a matter of indifference whether a young man who can work more efficiently at farming or some other handicraft than at preaching or the practice of law, shall try his fortune for a time, at one of these latter employments—then, through disappointment and disgust, relinquish it for something to which his powers are better adapted—or, before fixing on a vocation, try to find out what Nature intended him for, and choose the right thing first. Even if it were certain that his pride would allow him to give up a profession to which he had committed himself for some more congenial employment—to change what seems to him a calling of high honor for one of less esteem—he cannot carry to his new pursuit the freshness and enthusiasm necessary to enable him to work at it to the best purpose. His failure as a doctor of divinity or a doctor of laws may not disable him from becoming a good farmer; but there is little risk in saying that he would have been a better one had his energies been given to agriculture before his spirit was broken by disappointment and defeat in another pursuit. Let those, then, who have influence in directing the ambition of the young, teach them that there are as grand conquests to be made in the physical as in the intellectual world; and let the favorite motto of school professors—"Perseverantia Vincit Omnia"—be preceded, and its application modified, by the truth so pointedly expressed by the Latin poet—"Though you drive out Nature with a fork she will return again."

South Linton, N. Y., 1863.

I HAVE known some men possessed of good qualities, which were very serviceable to others, but useless to themselves; like a sun-dial on the front of a house, to inform the neighbors and passers-by, but not the owner within.

THOUGHTS.—Horace Walpole once remarked,—
"This world is a comedy to those who think, and a tragedy to those who feel."

PUBLIC LIBRARIES IN THE UNITED STATES.

The following interesting statistics of libraries have been furnished to the N. Y. Tribune by Mr. W. J. Brees, of Washington City, who has devoted several years to this subject, and the arrangement and examination of the collection of reports, documents, &c., in the Smithsonian Institute. There are fifty libraries in the United States containing upward of fifteen thousand volumes, thirteen containing over thirty thousand, and six over sixty thousand volumes.

The library of Harvard College, with its societies and departments, ranks highest on the list.

Massachusetts has eight libraries of the fifty, or one-sixth; New England, sixteen, or one-third; New York, eleven, or more than one-fourth.

The largest College Library in the North is Harvard, with 112,000 volumes; the largest in the South, Georgetown College, D. C., with 28,000 volumes.

The largest Mercantile or Mechanics' Library is that of New York City.

New York has the largest State Library, Indiana next, Maryland next.

Of the fifty libraries, thirty-seven are in Northern States, and three in the District of Columbia.

LIST OF THE FIFTY PRINCIPAL LIBRARIES IN THE U. S.

1. Harvard University, Cambridge, Mass.	112,000	11. Brown University, Providence, R. I.	37,000
2. Astor Library, New York, N. Y.	80,000	12. Public Library of City, Boston, Mass.	34,000
3. Athenæum, Boston, Mass.	70,000	13. Dartmouth College, Hanover, N. H.	32,000
4. Library Company of Philadelphia, Pa.	65,000	14. Bowdoin College, Brunswick, Me.	31,000
5. Library of Congress, Washington, D. C.	65,000	15. Theological Seminary, Andover, Mass.	26,000
6. Yale College, New Haven, Ct.	65,000	16. Georgetown College, Georgetown, D. C.	28,000
7. State Library, Albany, N. Y.	60,000	17. Am. Antiquarian Soc'y, Worcester, Mass.	20,000
8. Mercantile Library, New York, N. Y.	47,000	18. N. Y. Historical Soc'y, New York, N. Y.	26,000
9. N. Y. Society Library, New York, N. Y.	40,000	19. Union Theological Sem., New York, N. Y.	24,000
10. Smithsonian Institute, Washington, D. C.	10,000	20. Columbia College, New York, N. Y.	24,000
11. Brown University, Providence, R. I.	37,000	21. South Carolina College, Columbia, S. C.	20,000
12. Public Library of City, Boston, Mass.	34,000	22. University of Virginia, Univ. of Virginia, Va.	22,000
13. Dartmouth College, Hanover, N. H.	32,000	23. Dickinson College, Carlisle, Pa.	20,000
14. Bowdoin College, Brunswick, Me.	31,000	24. Athenæum, Indianapolis, Ind.	20,000
15. Theological Seminary, Andover, Mass.	26,000	25. State Library, Indianapolis, Ind.	20,000
16. Georgetown College, Georgetown, D. C.	28,000	26. State Library, Annapolis, Md.	20,000
17. Am. Antiquarian Soc'y, Worcester, Mass.	20,000	27. Amherst College, Amherst, Mass.	20,000
18. N. Y. Historical Soc'y, New York, N. Y.	26,000	28. St. Louis University, St. Louis, Mo.	20,000
19. Union Theological Sem., New York, N. Y.	24,000	29. Am. Philosophical Soc., Philadelphia, Pa.	20,000
20. Columbia College, New York, N. Y.	24,000	30. Charleston Library, Charleston, S. C.	20,000
21. South Carolina College, Columbia, S. C.	20,000	31. High School Library, Providence, R. I.	14,000
22. University of Virginia, Univ. of Virginia, Va.	22,000	32. Loyola College, Baltimore, Md.	14,000
23. Dickinson College, Carlisle, Pa.	20,000	33. Apprentices' Library, New York, N. Y.	14,000
24. Athenæum, Indianapolis, Ind.	20,000	34. College of New Jersey, Princeton, N. J.	10,000
25. State Library, Indianapolis, Ind.	20,000	35. State Library, Columbus, Ohio.	14,123
26. State Library, Annapolis, Md.	20,000	36. Mercantile Library, Boston, Mass.	18,000
27. Amherst College, Amherst, Mass.	20,000	37. University of Georgia, Athens, Ga.	18,000
28. St. Louis University, St. Louis, Mo.	20,000	38. Union College, Schenectady, N. Y.	16,000
29. Am. Philosophical Soc., Philadelphia, Pa.	20,000	39. Waterville College, Waterville, Me.	16,000
30. Charleston Library, Charleston, S. C.	20,000	40. Williams College, Williamstown, Mass.	16,000
31. High School Library, Providence, R. I.	14,000	41. Trinity College, Hartford, Ct.	15,000
32. Loyola College, Baltimore, Md.	14,000	42. State Library, Harrisburg, Pa.	15,000
33. Apprentices' Library, New York, N. Y.	14,000		
34. College of New Jersey, Princeton, N. J.	10,000		
35. State Library, Columbus, Ohio.	14,123		
36. Mercantile Library, Boston, Mass.	18,000		
37. University of Georgia, Athens, Ga.	18,000		
38. Union College, Schenectady, N. Y.	16,000		
39. Waterville College, Waterville, Me.	16,000		
40. Williams College, Williamstown, Mass.	16,000		
41. Trinity College, Hartford, Ct.	15,000		
42. State Library, Harrisburg, Pa.	15,000		

The number of volumes in the public libraries of the different States, (exclusive of school libraries,) is as follows:

State	Vols.	State	Vols.
Alabama	31,029	New Jersey	80,853
Arkansas	1,000	New York	617,484
Calif. rule	21,176	North Carolina	41,046
Connecticut	152,783	Ohio	206,288
Delaware	28,885	Pennsylvania	424,870
Florida	9,867	Rhode Island	14,235
Georgia	64,058	South Carolina	101,680
Illinois	43,688	Tennessee	82,904
Indiana	62,379	Texas	2,350
Iowa	8,150	Vermont	38,900
Kentucky	127,118	Virginia	134,646
Louisiana	60,680	Wisconsin	68,038
Maine	115,032	Wyoming Territory	1,147
Maryland	141,516	Washington Territory	2,962
Massachusetts	635,111	Minnesota Territory	5,900
Michigan	35,660	Kansas Territory	1,000
Mississippi	16,640	District Columbia	208,818
Missouri	68,696		
New Hampshire	88,602	Total	8,921,603

Massachusetts, it will be seen, stands first; New York, very near to her; Pennsylvania, third; District of Columbia, fourth, and Ohio, fifth. Only eleven States have over 100,000 volumes; of these, Maryland, Virginia, Kentucky, and South Carolina are Southern.

State	Vols.	State	Vols.
New York	617,484	Cincinnati, O.	71,700
Philadelphia, Pa.	250,228	Columbia, S. C.	65,000

Baltimore, Md.	95,644	Charleston, S. C.	38,000
Albany, N. Y.	93,427		

FALLACY OF PREMATURE EDUCATION.

WHEN we are considering the health of children, it is imperative not to omit the importance of keeping their brains fallow, as it were, for several of the first years of their existence. The mischief perpetrated by a contrary course, in the shape of bad health, peevish temper, and developed vanity, is incalculable. Some infant prodigy, which is a standard of mischief throughout its neighborhood, misleads them. But parents may be assured that this early work is not, by any means, all gain, even in the way of work. I suspect it is a loss; and that children who begin their education late, as it would be called, will rapidly overtake those who have been in the harness long before them.

And what advantage can it be that a child knows more at six years old than its compeer, especially if this is to be gained at a sacrifice of health, which may never be regained? There may be some excuse for this early book-work, in the case of those children who are to live by manual labor. It is worth while, perhaps, to run the risk of some physical injury to them, having only their early years in which we can teach them book-knowledge. The chance of mischief, too, will be less before more likely to be counteracted by their after life. But for a child who is to be at book-work for the first twenty years of its life, what folly it is to exhaust in the least its mental energy, which, after all, is its surest implement.

A similar course of argument applies to taking children early to church, and to over-developing their minds in any way. There is no knowing, moreover, the disgust and weariness that may grow up in the minds of young persons from their attention being prematurely claimed.—Arthur Helps.

MAMMOTH CAVE, KENTUCKY.

MANY and varied are the natural beauties and wonders of Kentucky—the most strange and magnificent of them all is the Mammoth Cave, the entrance to which is represented in our engraving. This Cave is situated near Green River, one hundred and thirty miles south-southwest of Lexington. It has been penetrated nine or ten miles, and has many windings that have not been explored. The depth is sixty or seventy feet. It contains figures some of which are of immense size and fantastic form; but is more remarkable for its extent than the variety or beauty of its productions, having none of the beautiful stalactites found in many other caves. The earth is strongly impregnated with saltpetre, and large quantities of it are manufactured.

The region which has received the visits of the explorer is divided into two hundred and twenty-six "avenues," forty-seven "domes," eight "catacombs," and twenty-three "pits," and, in addition to all these, there are a thousand and one marvellous scenes and objects claiming the attention of the visitor.

As may be supposed, there are many portions of this wonderful cavern which "human eye hath not seen"—portions in which the Spirit of Darkness has awed the adventurers into timidity, setting bounds to their progress—where the edict, "thou shalt thou come and no farther," has met with a frank, ready compliance. The desire to fathom these depths has exhibited itself occasionally, and the following graphic sketch—copied from the Louisville Journal—detailing a recent attempt to cast light upon the hidden and unexplored, will show our readers the dangers consequent upon such an undertaking. The "young gentleman" is, we believe, son of Geo. D. PRENTISS, the editor of the paper referred to:

"At the supposed end of what has always been considered the longest avenue of the Mammoth Cave, nine miles from its entrance, there is a pit, dark, and deep, and terrible, known as the Maelstrom. Tens of thousands have gazed into it with awe, whilst bengal lights were thrown down it to make its fearful depths visible, but none ever had the daring to explore it. The celebrated guide, STEPHEN, who was deemed insensible to fear, was offered six hundred dollars by the proprietors of the Cave, if he would descend to the bottom of it, but he shrank from the peril. A few years ago, a Tennessee professor, a learned and bold man, resolved to do what no one before him had dared to do, and, making arrangements with great care and precaution, he had himself lowered down by a strong rope, a hundred feet, but, at that point, his courage failed him, and he called aloud to be drawn out. No human power could ever have induced him to repeat the appalling experiment.

A couple of weeks ago, however, a young gentleman at Louisville, whose nerves never trembled at mortal peril, being at the Mammoth Cave with Prof. WALKER of our city, and others, determined, no matter what the dangers and difficulties might be, to explore the depths of the Maelstrom. Mr. PROCTOR, the enterprising proprietor of the Cave, sent to Nashville and procured a long rope of great strength expressly for the purpose. The rope and some necessary timbers were borne by the guides and others to the point of proposed exploration. The arrangements being soon completed, the rope, with a heavy fragment of rock affixed to it, was let down and swung to and fro to dislodge any loose rock that would be likely to fall at the touch. Several were thus dislodged, and the long-continued reverberations rising up like distant thunder from below, proclaimed the depth of the horrid chasm. Then the young hero of the occasion, with several hats drawn over his head to protect it as far as possible against any masses falling from above, and with a light in his hand and the rope fastened around his body, took his place over the awful pit and directed the half dozen men, who held the end of the rope, to let him down into the Cimmerian gloom.

We have heard from his own lips an account of his descent. Occasionally masses of earth and rock went whizzing past, but none struck him. Thirty or forty feet from the top, he saw a ledge, from which, as he judged by appearances, two or three avenues led off in different directions. About a hundred feet from the top, a cataract from the side of the pit went rushing down the abyss, and, as he descended by the side of the falling water and in the midst of the spray, he felt apprehension that his light would be extinguished, but his care prevented this. He was landed at the bottom of the pit, a hundred and ninety feet from the top. He found it almost perfectly circular, about 18 feet in diameter, with a small opening at one point, leading to a fine chamber of no great extent. He found on the floor beautiful specimens of black siliceous of immense size, vastly larger than were ever discovered in any other part of the Mammoth Cave, and also a multitude of exquisite formations as pure and white as virgin snow. Making himself heard, with great effort, by his friends, he at length asked them to pull him partly up, intending stop on the way and explore a cave that he had observed opening about forty feet above the bottom of the pit. Reaching the mouth of that cave, he swung himself with much exertion into it, and, holding the end of the rope in his hand, he incautiously let it go, and it swung out apparently beyond his reach.

This situation was a fearful one, and his friends above could do nothing for him. Soon, however, he made a hook of the end of his lamp, and, by extending himself as far over the verge as possible without falling, he succeeded in securing the rope. Fastening it to a rock, he followed the avenue 150 or 200 yards to a point where he found it blocked by an impassable avalanche of rock and earth.

Returning to the mouth of this avenue, he beheld an almost exactly similar mouth of another on the opposite side of the pit, but not being able to swing himself into it, he re-fastened the rope around his body, suspended himself again over the abyss, and shouted to his friends to raise him to the top. The pull was an exceedingly severe one, and the rope, being ill adjusted around his body, gave him the most excruciating pain. But soon his pain was forgotten in a new and dreadful peril. When he was 90 feet from the mouth of the pit, and 100 from the bottom, swaying and swinging in mid-air, he heard rapid and excited words of horror and alarm above, and soon learned that the rope by which he was upheld had taken fire from the friction of the timber over which it passed. Several more moments of awful suspense to those above, and still more awful to him below, ensued.

To them and him a fatal and instant catastrophe seemed inevitable. But the fire was extinguished with a bottle of water belonging to himself, and then the party above, though almost exhausted by their labors, succeeded in drawing him to the top. He was as calm and self-possessed as upon his entrance into the pit, but all of his companions, overcome by fatigue, sank down upon the ground, and his friend, Prof. WALKER, from over-exertion and excitement, fainted and remained for a time insensible.

The young adventurer left his name carved in the depths of the Maelstrom—the name of the first and only person that ever gazed upon its mysteries."

EXTENT OF THE ROMAN EMPIRE.

WE are sometimes under a little delusion in the estimates we form of the magnificence of the Roman Empire, or the multitude of troops that it maintained. Russia surpasses it in extent of territory, and maintains an army considerably more numerous. France and Austria, who rank next to Russia in the number of their standing armies, could singly bring into the field a much larger force than the whole Roman Empire. The military force of the Pagan Empire is here estimated at 450,000 men; the Christian monarchies of France and Austria are each of them reputed to maintain an army of 650,000 men. And when we reflect upon the invention of gunpowder and the enormous force of artillery, it is evident that any one of the first rate powers of modern Europe could bring into the field a destructive force that would sweep from the face of the earth the thirty legions of Adrian. The very division of Europe into a number of States involves this increase of soldiery. In the old Roman Empire the great Mediterranean sea lay peaceful as a lake, and the Roman ships had nothing to dread but the winds and the waves; whereas, in modern Europe many artificial boundaries have to be guarded by an array of soldiers. "Belgium defends her flats with a hundred thousand men, and the marshes of Holland are secured by sixty thousand Dutch." Hitherto everything has tended to develop the military power in Christendom.—White's Eighteenth Century.

SCIENTIFIC PARADOXES.

THE water which drowns us, a fluent stream, can be walked upon as ice. The bullet, which, when fired from the musket, carries death, will be harmless, if ground to dust before being fired. The crystallized part of the oil of roses, so grateful in its fragrance—a solid at ordinary temperatures though readily volatile—is a compound substance, containing exactly the same elements, and in exactly the same proportions, as the gas with which we light our streets. The tea which we daily drink, with benefit and pleasure, produces palpitations, nervous tremblings, and even paralysis, if taken in excess; yet the peculiar organic agent called theine to which tea owes its qualities, may be taken by itself (as theine, not as tea) without any appreciable effect. The water which will allay our burning thirst augments it when congealed into snow; so that Captain Ross declares the natives of Arctic regions "prefer enduring the utmost extremity of thirst rather than attempt to remove it by eating snow." Yet if the snow be melted it becomes drinkable water. Nevertheless, although, if melted before entering the mouth, it assuages thirst like other water, when melted in the mouth it has the opposite effect. To render this paradox more striking, we have only to remember that ice, which melts more slowly in the mouth, is very inefficient for allaying thirst.—Blackwood's Magazine.

The Young Ruralist.

CLERKS UNSUITED FOR THE WEST, AGAIN.

MASSA EDITORS:—In order to convince an intelligent community that one thing is right and the other wrong, it is proper that both sides of the question be presented before their eyes, and leave them to draw whatever inferences they please. A correspondent in the Rural comes out with a determined "WILL," to throw my argument, concerning clerks being unsuited for the West, entirely in the shade. He has not done a great amount of execution, as I shall proceed to show.

He says, in the first place, that I have not advanced a single proof to maintain my position.—WILLIAM should at first look and see if he himself has presented any proofs. A His experience cannot be brought in as argument. Supposing what he has said to be true, it will not apply in this case. Because one lucky chap found a lump of gold on Fraser River, will every adventurer meet with like favors? Or, does WILL suppose because he is successful in his new pursuit, that every clerk who follows his heels, is attended with like success? The ill-application of his "experience" is manifest. The candid truth is, that he in fact must have had a strong liking to farming, inasmuch as he has made such rapid strides in improvement. As stated in the original article under discussion, did he leave the city, buy a farm, and with his own manual labor prepare it for cultivation? Far from it. Many persons leave the city and work on a farm, but they do not venture on their own resources—dependent on their own efforts to render the "mother earth," in its natural state, fit for cultivation. (b) Plenty of proofs or reasons may be brought forward, to show that poor sickly clerks are unsuited to the West.

(c) Young persons who are reared in the city, and hold positions in stores, are led to believe that any kind of real manual labor is beneath their dignity. This natural repugnance to toil is so bred into their vital organs, that the powers of the immortal Jupiter could not induce them to leave the cozy shop corners, and swing the axe, or perform any of the rough, exhaustive labor which those who enter upon a new farm are obliged to undergo. If they would go West, what success would crown their weak efforts? On looking at their times in the city, in comparison with the heavy drudgery now imposed upon them, they become discouraged, and for other reasons also they become disgusted, and return to their former calling. I have seen some "experience" in such cases.

Clerks are unaccustomed to farm labor, and hence their inability to perform the duties of the farm. Some practice is needed to break a person into the duties of preparing the soil. A clerk cannot be expected to understand the manner in which things work. I would ask, was it sickly clerks who made the broad West what it is, or could they make it what it is? It was not puffy, feeble persons, but brave, sturdy pioneers, taught to earn their own bread from the earth all their lives. Life in the West is more poetical than profitable—that has been often exemplified.

Barter is necessary to our welfare in life—farming is particularly so. The farmer and the clerk are intimately connected in life's business. The husbandman brings in produce, it is taken to the market, and he finds a purchaser. No man is independent of his fellow beings. The tradesman is useful, the farmer is useful, and both must exist—Here I will leave off. If "WILL" can send on any more "experience," let it come! I will then say myself on a rack to dry up). J. W.

Moore Co., N. Y., 1863.

REMARKS.—As J. W., and other of our young friends seem to be desiring altogether too liberally in words, and too little in argument, we will make a few remarks on the above, and we do this for the benefit of all writers for this department. Young writers should avoid wild statements and loose arguments.

(a) The fact that one clerk gains health and strength by working on a farm, and is prosperous, is a good argument in favor of the position, that like results would follow in similar cases, unless it is shown that some peculiar advantages were possessed by him, to give the favorable results that would not be generally enjoyed by clerks. This fact seems to have been understood by J. W., for he claims that "WILL" must have had a strong liking to farming, to have made such rapid strides in improvement." To this must be answered, no one will succeed in any work that requires the untiring exercise of head and hands, unless he has a liking for it. Every one will not succeed in any business—no one expects, or would argue in its favor. The Fraser River illustration is not good—one is a business in which skill and industry generally succeeds—the other a chance business, more like a lottery, in which the most wise and the most laborious are likely to fail.

(b) "Poor sickly clerks"—If their sickness is of such a nature that air and exercise will not effect a cure, of course they are unsuited for this, or any laborious occupation. If they are poor and sickly because they are clerks, the change, by removing the cause, would of course, remove the effect.

(c) The question was not whether clerks could be induced to go West and engage in farming, but whether it would not be to their advantage?

We will not argue this question, and only make these few notes for the benefit of young writers for this department, to show them the necessity of keeping close to the point.

BUENA VISTA BEANS.—Five years ago I received a small sample of this variety of beans from I. W. BRIDGES, Esq., of Wayne Co., N. Y., which I have been cultivating to a limited extent ever since. The present season, I raised on 1-4 acre of rather poor sandy loam, without manure, 44 bushels, or 18 bushels to the acre; the ground was plowed, harrowed and planted on the 10th of June; rows 3 feet apart, and sowed in the rows at the rate of 12 seeds to the foot. They were pulled and threshed Sept 30th. Of course I do not consider this a large yield, but I think it a paying crop. The Buena Vista Beans are small, pale red, (almost white) prolific, early, and ripen evenly. If any of your readers wish to try them, I will send a sample gratis, by mail, on receipt of a stamped envelope. I enclose a sample of Field Beans, which have been cultivated for a few years past, about here. I believe they were brought from Connecticut. They are not so early or prolific as the Buena Vista Beans, I think, though I have not given them a fair trial. If you can give me their name I will be much obliged.—R. B. E., Ayres, Indiana Co., Pa.

REMARKS.—The beans sent us were the Bush Kidney Bean, a very good field or garden bean.

An insult is very humiliating to him who utters it, when it does not succeed in humiliating the person to whom it is directed.

ROCHESTER, N. Y., NOVEMBER 6, 1859.

The Rural for 1859—Briefly.

TAKING Time by the forelock, we wish to announce, very briefly but decidedly, that such arrangements are being perfected as will render the Tenth Volume of the RURAL NEW-YORKER "Excelsior" in both Contents and Appearance, and we trust, worthy of a far larger and wider circulation than any preceding volume has attained. Profoundly grateful for the extraordinary encouragement and support it is receiving at the hand of the Farmers, Horticulturists, Mechanics, Merchants and Professional Men, from Canada to the Gulf and Maine to Minnesota, we have resolved to make such "Progress and Improvement" in Style, Terms, &c., as will, while fully maintaining its value and superiority, render it more attractive and interesting, and place it within the reach and means of thousands to whom its club rates have heretofore been objectionable. And if its friends, near and distant, shall second our endeavors to increase its value, by corresponding efforts to augment its subscription list and consequent influence in their respective localities, the RURAL's pre-eminence as the first Journal of its Class in MERIT, USEFULNESS AND POPULARITY, will be more than maintained. All who desire to aid in the good work are cordially invited to manifest the same by preparing for an early and earnest opening of the Campaign. Show-Bills, Prospectuses, Specimen Numbers, &c., will be cheerfully furnished to all applicants. See Special Notices, &c., in first column of next page.

ATHLETIC LECTURES.—The next Annual Course of Lectures before the Rochester Athenaeum and Mechanics' Association will commence on Thursday evening next, (Nov. 11.) The Course will consist of fifteen lectures, by some of the most eminent lecturers in this country—comprising such stars as Rev. Dr. Storrs, Rev. H. Ward Beecher, Geo. W. Curtis, Rev. A. Willits, Lieut. Manly, Rev. E. H. Chapin, Bayard Taylor, Rev. A. L. Stone, E. P. Whipple, Rev. T. Starr King, Geo. D. Prentice, Rev. Dr. Bellows, &c. It is needless to add that such an array of talent is rarely embraced in a single lecture course, even in the Atlantic cities—or that the course must prove popular, as well as profitable to both the Association and its patrons. The introductory lecture will be given by Rev. Dr. Storrs, of Brooklyn, on a semi-scientific subject—"The Effects of Climate on Civilization." Tickets for the Course can be obtained at the Bookstores, or either of the Directors of the Association, or of the President at this office.

CONGRESSIONAL ELECTIONS.—To-day (Tuesday) Congressmen are to be elected in six States, New York, Massachusetts, Michigan, New Jersey, Illinois and Wisconsin. These States send sixty-five Representatives, who, in the present Congress, are politically divided as follows:

	Opp.	Dem.
Massachusetts	11	11
New York	21	12
New Jersey	2	3
Michigan	2	3
Illinois	4	6
Wisconsin	4	3
Totals	45	20

A great struggle is being made by the Opposition for a gain in New York, New Jersey, and Illinois in order to make the next House an Anti-Administration one.

Washington Matters.

THE movements of Gen. Walker are regarded with much interest, especially in diplomatic circles, it being represented that he is well supplied with both men and money for his professedly peaceful enterprise. There is reason to believe that should he attempt to land with his followers in Nicaragua, he will be repulsed by the British naval forces, as the Admiral on the W. L. station, it is intimated, has instructions to arrest filibustering expeditions into Central America from any quarter. Past, as well as present events, strengthen the assertion.

New parties have recently been endeavoring to secure the government's recognition of another contemplated Transit Line over the Nicaraguan, and with whom Gen. Jerez had been in communication. No success has thus far attended their efforts. While the administration will not interfere between citizens in matters relating to that subject, those who have already contracted with the Nicaraguan government will be fully protected in their rights and property.

The telegraph, on the 30th ult., informs us that the President has prepared, and will forthwith issue, a proclamation in the usual form for the prevention of filibustering expeditions to Central America. The document has appeared, and we may revert to it hereafter.

The Attorney General has given an opinion in reference to the proper construction of the Act of June last, which provides that the title to a land warrant issued after the death of a person who has applied for it according to the prescribed forms, shall vest in the widow, if there be one, and if there be no widow, the heirs and legatees of the claimant. He draws the following conclusions:—1st. That a warrant issued after the death of a claimant who has left a widow and children, is for the widow's benefit alone. 2d. If the deceased claimant leaves a wife with two sets of children, the warrant ensures to the benefit of the heirs and legatees. And, 3d. The heirs are those who are so declared by the law of claimant's domicile.

Information has been received that Paraguay has 300 newly-mounted guns on stone batteries at the mouth of the Parana. A large land force will be needed to turn the fortifications from the land side.

The War Department has a dispatch confirming the accounts of the engagement of Maj. Dorn with the Camanches. Fifty-two warriors and two women were killed. Secretary Floyd will take immediate measures to increase the force in Texas.

It is said there is in course of preparation at the State Department a reply to the official dispatch informing our government of the purpose of Great Britain to suppress the filibustering in Central America.

The State Department having reason to suppose that some irresponsible persons in England and others there, writing under assumed names, have induced persons in this country to forward remittances thither for the recovery of estates which they are led to believe they are entitled to, cautions persons to whom such representations are made to be satisfied as to the identity of their correspondents.

The dispatch to the Times says that government has received dispatches from Gen. Lamar, announcing intelligence that Costa Rica promptly retroacts her offensive language, and says that had M. Bely been as well known as he is now, the language would never have been used. The lake boats had proceeded up the river without interruption.

The War Department has received official accounts of two late battles in Washington Territory. Gen. Clark presumes the success narrated therein is a surety of peace with the Indians—the red men having been soundly beaten and some frightened into earnest overtures of peace. The contents of Lieut. Tyler's letters are all thus confirmed.

The Washington Union of the 30th ult., speaking by authority, says the policy of the United States is not to acquire Central America or any part of it, but to open the Isthmus routes and have them free to all the world. Meanwhile that it is but fair to claim that the covenants made with our people shall be enforced. Not only has Costa Rica made ample apology to our government but received Gen. Lamar with great cordiality. He will attend the Convention of the Central American States about to be held, with a view to effect the confederation thereof.

LATE NEWS FROM THE OREGON WAR.—The Hartford (Conn.) Times of the 29th ult., says:—"We have a letter from Lt. Clair, of the U. S. Oregon Army, dated at Coeur d'Alene Mission, Washington Territory, of Sept. 15, with fifteen days later news from there. The Shokan and Palouse Indians had been defeated, after two days' fighting. The Shokan Chief was held by the U. S. forces, and 900 horses had been taken from the Palouse tribe. All the plunder which the Indians took from Col. Steptoe's command had been recovered. Col. Steptoe's pistol was found upon an Indian who was shot down in his saddle. The army did not lose a man. The Indians were begging for peace, and complying with all the demands of the U. S. officers. Lt. Clair considers the war in that quarter ended.—His letter was expressed to Fort Taylor on Snake river, near Wallawalla, by the Indian runners. It was directed to his father, who resides in this city, and was probably the only letter that came through by the California steamer, with news of the Oregon war."

MORPHY AND HARRWITZ.—TERMINATION OF THE MATCH.—The Paris correspondent of the Boston Traveler writes that journal as follows:—"The match has just been settled, and Mr. Morphy declared the winner, all bets being paid. They were to have played until one or the other had won seven games; but when they stood Morphy five and Harrwitz two, the latter gave it up, laying the blame of his defeat to his ill-health; but the fact is, Morphy is by far the best player. When the termination of the match was announced at the Cafe de la Regence, the rendezvous of the chess players here, the Americans assembled there were quite uproarious in their exultation, while the Germans and the Prussians, who had bet upon Harrwitz, immediately suffered a terrible elongation of countenance. Still they continue to have hope, for another person has been sent for to try his hand at playing with the formidable young American, and the person is a countryman of theirs."

Letter from Nebraska Territory.

The Rural—First Ag Fair of Otoe County—Agricultural Products—Fruit Growing, &c., &c.

NEBRASKA CITY, Oct. 9th, 1858.

EDS. RURAL:—Among the many eastern newspapers which I take, there is none so welcome in my family as your valuable NEW-YORKER. We look for its coming every week, with no ordinary feeling of pleasure, and I can assure you that its pages are well scanned over. It has occurred to me that a few jottings from this out of the way place would not come amiss to some of your readers, and I have thought proper to take up my pen and give you, in my random style, some few remarks about matters and things appertaining to our Territory.

We have this week had a taste of agricultural matters. The Agricultural Society of Otoe County have, the last two days, been holding their First Fair in this city, and, taking all things into consideration, the exhibition of horses, cattle, hogs, sheep, and the products of the soil, has been such as will compare favorably with a good many such Shows in the States. For the raising of corn, potatoes, and pumpkins, the soil of Nebraska cannot be excelled. We have raised pumpkins here weighing one hundred and seventy-five pounds, and corn that takes only eleven ears to make a half bushel. Our first Fair was very well attended. The ladies turned out with all sorts of fancy articles for exhibition, and a spirit of laudable emulation has been created that will tell at the next Show of the Society, and will materially advance the interests of farmers and the country generally. Agriculture in this portion of the Territory, is now securing a good deal more attention than it hitherto has done. Speculation in paper towns and town lots has in a great measure subsided, and a good deal more attention is directed towards cultivating the soil. We have here farmers from almost every State in the Union, and the extensive prairies, that some four years ago were used only as the hunting grounds of the Pawnees and Otoes, are now dotted over with cornfields, and the huts of the settlers are getting thickly scattered over the country, showing a degree of prosperity in this Territory of a permanent character.

A new impetus has been given to improvement, and our Fair has brought our farmers together. There has been an entire change of sentiment, and the excellent address, delivered by the Hon. SAMUEL W. BLACK, has sent the farmers home wiser and better men, and with a still stronger determination to "stick to the plow."

The South Platte Country is settling up very fast with an industrious, thriving population. The postponement of the land sales in the Territory, was a god-send to the settler, and will secure to the actual tillers of the soil many thousands of acres of rich land, which would otherwise have fallen into the spacious maw of the land speculator.

The streets of Nebraska City have lately been crowded with wagons and cattle, owned by parties on their way to the newly discovered gold region at Pike's Peak, and a good many of our citizens have caught the gold fever, and are now on their way to the auriferous region. This city, for the upper Missouri, is about the best starting point, the gold mines being some 650 miles distant. The news received from the gold region continues to be of a very favorable character, and emigration from Iowa, Missouri, and this Territory, will this fall be very large.

The crops of corn, potatoes, pumpkins, &c., in this Territory, have this year been very large and good, and the corn is now out of the way of any danger from frost. I have been a resident of the Territory some three years, and have noticed that our first frosts come generally about the 15th of October—from that to the 20th. The planting of fruit trees has the past season been carried on extensively, and the trees have done remarkably well.

To the poor man, wishing to pre-empt a quarter section of as good land as the sun ever shone on, the Territory of Nebraska offers immense advantages. Thousands of acres of fine rolling prairie yet invite the settler, and the soil yields an ample compensation to the farmer for his labor.

But I am afraid I shall trespass too much upon your indulgence, and therefore conclude.

J. GARRIDE.

OBITUARY.—HON. ALVAN HUNT, formerly State Senator from the Chenango District, N. Y., and more recently State Treasurer, died in Brooklyn, on the 28th ult. His disease was paralysis, brought on by mental anxiety on account of the serious illness of his wife. He was a man of fine abilities and rare social qualities. His age was sixty years.

HON. ROBERT RANTOUL, of Beverly, Mass., died at Beverly, Sunday week, at the age of 79 years. Mr. RANTOUL has been an honored and distinguished citizen of Massachusetts, and has taken an active part in the legislation of the State in days gone by. He first served in the Legislature in 1809.

DEATH OF REV. MR. SAWYER, AT THE AGE OF 103.—The Bangor papers bring intelligence of the death of Rev. Father Sawyer, of that city, at the age of one hundred and three years and four days. He was probably the oldest clergyman in the United States.

SUBMARINE CABLE ACROSS THE NIAGARA RIVER.—The Buffalo Commercial of the 30th ult., says:—"As we go to press, a submarine telegraph cable is being laid across the Niagara, by the Montreal Telegraph Company. The cable, we are informed, is a portion of that employed in the Gulf of New Foundland, but abandoned on account of being too heavy. It is wound upon a large reel, which was placed on a scow, and towed by a steam-tug across the river. The cable is about one inch and a half in diameter, and contains three conducting wires, each one being thoroughly insulated. Its weight and strength peculiarly fit it for the swift current of the Niagara. Its length is something over three-fourths of a mile. The machinery employed in the submersion is the same that has been used by the same Company in laying cables in the St. Lawrence and other rivers."

THE Queen Dowager of Spain has two millions of dollars invested in this country. Other crowned heads of Europe also have large investments here. Louis Napoleon has from three to five millions. The petty German Princes, it is stated, are interested in American securities about \$50,000,000.

Foreign Intelligence.

Arrival of the Persia and Vigo.

THE Persia from Liverpool 4 P. M., 16th inst., and the Vigo from the same port, 13th, arrived in New York on the 26th ult.

GRAND BRITAIN.—The race for the Cesarewitch handicap was won by Rocket by a head. Priores and the Brewer ran a dead heat for the second prize. The fact that Priores a second time ran a dead heat for this race, though this time for the second prize, is one of the most remarkable incidents connected with the Cesarewitch.

At the regular meeting of the iron masters at Birmingham, a greatly improved tone was observable. Buyers were numerous and prices were firmly maintained, while the principal manufacturers were reluctant to enter into contracts for delivery at distant dates.

The officers and crew of the ill fated Austria had published a letter claiming that they did all that was possible to do under the circumstances, and that the captain did the same.

FRANCE.—The mediation of a friendly power has been accepted by France and Portugal, in the dispute between them. It was suggested that the Portuguese Government should order the Charles Georges to begin upon condition that the French ships of war should previously withdraw from the Tagus, and return to France, so as to let it appear that the surrender was not made under the menace of the guns.

The decrees permitting the importation of foreign iron into France, was about to be renewed with modification.

The monthly statement of the Bank of France shows a decrease in the bullion of £1,770,000. The discounts had increased £1,350,000.

The latest accounts from Paris say no doubt was entertained of a pacific solution of the difficulties with Portugal.

AUSTRIA.—A panic was prevailing on 'change at Vienna, caused by fears of the speculators at the approaching resumption of cash payments by the bank.

The Cologne Gazette says Austria will demand explanations from the Pope, respecting the augmentation of the French forces at Rome.

PORTUGAL.—The free importation of breadstuffs is permitted until the end of May, 1859.

MOROCCO.—The Vice-Consuls of Spain and France at Tetuan, Morocco, had been assassinated. No particulars. Energetic measures to obtain satisfaction were expected. A Paris telegram says the two ships of war lately sent to Lisbon would proceed to Tetuan to avenge the massacre.

TURKEY.—The Turks in Candia had again made such a display that it was feared the massacre of the Christians was intended. Great excitement prevailed. Two additional battalions of troops were to be sent to the island. Reports are received that the Porte had refused to cede the Island of Perim to England.

INDIA.—The Bombay mail of Sept. 24th, had arrived at Suez. The diarmat at Mooltan mutinied on the 21st of August, and their almost total extermination was the consequence. The fugitive rebels from Lowree were defeated with great slaughter Sept. 10. The Gwalior fugitives, after occupying the town a week and securing a large amount of treasure and forty guns, were again defeated, on the 13th of September, and dispersed in all directions. A private telegram says that a renewed alarm has arisen at Calcutta, and that the troops were kept under arms. Seven thousand insurgents were said to be in the Province of Calcutta, but avoiding engagements.

CHINA.—The Hong Kong mail of Aug. 24th, had reached England. It is rumored at Canton, that one of the Commissioners who met the Ambassador at the North, and who bears a character for conciliation, had been appointed Viceroy of the Canton Province.

The town of Canton was spared by the British, though the forts were destroyed. The report that the place was sacked, was unfounded.

The Chinese were coming back by degrees to Hong Kong and Macao. Trade continued dull at Hong Kong. At Amoy, little or nothing had been done in Teas. At Shanghai the exports were 8,000,000 pounds short of last year.

AUSTRALIA.—The Australian mail of Aug. 16, had reached England. The news anticipated. A nugget of gold weighing 2,100 ounces was being exhibited at Melbourne. The electric telegraph was in operation between Melbourne and Adelaide.

Commercial Intelligence.

BREADSTUFFS.—Flour dull. Western canal 20@22c. Ohio 22-24-6d. Wheat very dull and nominal. Red Western 63@64d. White 63@64d. Corn lower but nominal at 31c@32c. White 33@34c@35c.

PROVISIONS.—Pork quiet. French and Irish rather lower. Bacon dull at late rates. Lard 1@2d cheaper. Sales at 58c, and market dull at decline.

News Paragraphs.

THE vein of plumbago, in Puzzle Mountain, in Newry, Me., has been worked through, and the supply, which was supposed to be almost inexhaustible, has proved to be very limited. Not a great quantity was procured.

CALIFORNIA law says neither negro, mulatto nor Indian shall be accepted as evidence against a white man, either in civil or criminal suits. But lately a local Judge has over-ruled the harsh statute so far as to admit the proscribed classes in all cases where they are the injured parties; and since then colored evidence is freely accepted in the criminal courts, showing a revolution in public sentiment.

THE old managers of the National Monument at Washington have been restored to power, and promise to complete the shaft, if nothing more, as soon as they can get the money. The column is now 175 feet high. The plan is to have it 600.

THE New Orleans Picayune states that a ship and a bark, the former having eighty and the latter forty camels on board, had arrived off the Southwest Pass, and have been ordered to Galveston.—These camels are imported by private enterprise.

A CORRESPONDENT of the St. Louis Democrat, who has undertaken a careful exploration of the Pike's Peak gold mines in Kansas, writes that the stories of the discoveries of large lumps of gold and of great yields, are wholly unfounded, and that the gold found in that region is "wash-gold," from which careful men may possibly realize \$250 to \$3 per day.

SOMEbody has said that the marriage between Jonathan and Miss Great Britain, which was so brilliantly celebrated a short time ago, is evidently a very unhappy one. At all events, no words have passed between them since the bridal day.

THE Chicago Board of Trade, have responded to the Boards of Canada, in favor of such a change in the Reciprocity Treaty as will allow flour manufactured in Canada, from wheat grown in the United States, to be admitted in our ports free of duty. The Secretary of the Treasury has decided against the free admission, much against the interest of the Canadians.

The News Condenser.

—Thanksgiving in New Jersey on the 18th of November.

—There are 305 places of worship in the city of Philadelphia.

—Philadelphia is the healthiest of the large cities in the Union.

—Thanksgiving in Pennsylvania Nov. 18th, and Massachusetts 25th.

—The Natchez Courier says New Orleans is the filthiest city in the U. S.

—There were 2436 deaths in Montreal for the year ending July 4th, 1858.

—Nearly all the mills of Lowell, Mass., are now running, and all on full time.

—The soil of Turkey is found to be very favorable to the growth of cotton.

—An organization is about to be made in New York for a steam fire engine.

—The Costa Rican Government has apologized for the deluge of Mons. Bely.

—More than one hundred miles of railroad will be completed in Texas in 1859.

—The line of telegraph from Placerville to Salt Lake City has been commenced.

—Silver is arriving at San Francisco from Arizona at the rate of \$1,000 per week.

—It is said a child was recently born in Canada, weighing "twenty-two pounds."

—Charles S. Stratton, the original Tom Thumb, is showing himself in Manchester, Eng.

—The Great Western Railway Co. are about to replace all their wooden bridges by iron ones.

—Snow fell in Ashtabula Co., Ohio, on Thursday night of last week, to the depth of nine inches.

—The great horse exhibition on Long Island closed on Friday week. It was very successful.

—It has been decided, lately, in court that the word "children" in a will includes grandchildren.

—Brigham Young has been sued for \$25,000 damages, by a Mr. McNeill, for false imprisonment.

—A child, four years old, with a fine growth of beard and whiskers, is on exhibition in New York.

—The New York Times predicts that Kansas will be admitted this winter without much resistance.

—Stewart, the proprietor of the "Marble Halls" in Broadway, employs, in that establishment, 263 clerks!

—A young lady, 15 years of age, sent to the State Fair in Connecticut a quilt containing 10,000 pieces.

—Alexander Duncan, of Providence, is taxed for over \$4,000,000. He is the richest man in New England.

—A batch of New York city officials and contractors have just been indicted for frauds and swindling.

—The first new corn of this season was sold in Chicago Ill., a few days ago, at 40 cents per bushel of 60 pounds.

—Within a few months the police of New York have made 20,000 complaints for violations of the Sunday laws.

—The Grand Division Sons of Temperance of the State of Kentucky is in session at Richmond, in that State.

—There were three hundred and sixty deaths in New York last week, a decrease of seventy on the previous week.

—On the night of the 12th ult., 12 births were reported in the family of Heber C. Kimball, at Salt Lake City, U. T.

—It seems to be settled that the British Government will lay a second Cable between Ireland and Newfoundland.

—Jonathan Robbins, who died in Middlesex Co., Mass., last week, weighed four hundred and sixty-five pounds.

—It is thought the trip of the overland mail between St. Louis and San Francisco will ultimately be made in 20 days.

—Judge Balcom, last week, directed a Grand Jury in New York to find indictments against adulterers of liquor.

—The Hebrews of Norfolk, Va., have formed a military company of thirty-five men, and elected J. Umstadter captain.

—The State of Virginia taxes the railroads of the State one mill per mile for every passenger carried over their roads.

—The work of breaking up the iron remains of the late Crystal Palace, under direction of the corporation, is in progress.

—A gentleman in New Haven picked ripe strawberries from his garden on the 27th ult. At least the Boston Post says he did.

—Three men, named McGrade, Butler and Roach, were lately suffocated to death by foul air, while sinking a well near Chicago.

—A convention to secure more uniformity in Telegraphing was held in New York during the last three days of last week.

—A large emigration from North Carolina to the West is going on. A caravan of 59 persons left Lincoln Co., N. C., last week.

—The Jockey Club at Paris, the senate of elegants and dandies, has just been passing laws on evening costume for gentlemen.

—Mr. Peabody has added \$200,000 to his former donation to the Peabody Institute, Baltimore, making the whole endowment \$500,000.

—M. Donati, the discoverer of the comet lately visible, has been appointed Assistant Astronomer of the Imperial Museum of Florence.

—The members of the Cabinet at Washington are reported to be busily engaged in preparing their respective reports for Congress.

—The costume of the Spanish ladies has not changed for 200 years. They wear the same style of dress their great grandmothers did.

—The official list of passengers on board the burnt steamer Aetna, arrived by the Europa. It shows that 455 lives were lost, 88 saved.

—During the year 1850 there were 230,000 persons employed in the collieries of Great Britain, and 66,000,000 tons of coal were raised.

—Bishop Soule, of the M. E. Church South, is in very feeble health, and incapacitated from replying to his numerous correspondents.

—The St. Louis steamer, the "Fishing Cloud" and "Rodolph," were sunk on the 17th ult., with large cargoes, one of them very valuable.

—An extra session of the Legislature of Indiana composed of newly elected members and Senators holding over, will convene on the 20th inst.

—The London Times says that the duration of a ship of war in a seaway state, built of British oak, is only thirteen years of active service.

—A private meeting of prominent New York firemen was held on Saturday week, to consider the subject of procuring a steam fire engine.

—The salt pond proprietors of Turks Island recently held a meeting to devise measures for importing a supply of laborers into the colony.

—The Apache Indians, at the last accounts were preparing for a hostile expedition into Sonora, and the Mexicans raising an army to oppose them.

—The "Derby Dilly," the last of the mail coaches running out of Manchester, Eng., succumbed to railway competition on the 9th ult.

—The Governor has refused to interfere in the execution of the sentence passed upon the boy Rogers, the murderer of Mr. Swanson, in N. Y. city.

MOORE'S RURAL NEW-YORKER,
AN ORIGINAL WEEKLY
Agricultural, Literary and Family Newspaper.
CONDUCTED BY D. D. T. MOORE,
WITH AN ABLE CORPS OF ASSISTANT EDITORS.

THE RURAL NEW-YORKER is designed to be unsurpassed in Value, Purity, Usefulness and Variety of Contents, and unique and beautiful in Appearance. Its Conductor devotes his personal attention to the supervision of its various departments, and carefully labors to render the RURAL an entirely Reliable Guide on the important practical, scientific and other subjects intimately connected with the business of those whose interests it seasonably advocates. It embraces more Agricultural, Horticultural, Scientific, Educational, Literary and News Matter, interspersed with appropriate and beautiful Engravings, than any other journal, rendering it the most complete AGRICULTURAL, LITERARY AND FAMILY JOURNAL in America.

All communications and business letters, should be addressed to D. D. T. MOORE, Rochester, N. Y.

For Terms and other particulars, see last page.

Rural New-Yorker.

AGRICULTURAL CLUBS, LECTURES, &c.

As the Lecture Season has again arrived, or is rapidly approaching, we desire to offer a few suggestions to Ruralists as to the importance and manner of securing Addresses, Lectures, and Discussions, before Agricultural Societies, Clubs, &c., during the Winter.

Farmers and their families have more leisure during Winter than any other class in this country, and if this were properly occupied great progress might be made in mental improvement, and in acquiring useful knowledge. In Western New York, and many other sections, the great mass of our readers can avail themselves of the advantages of associated effort—are so situated that they can easily form Societies and Clubs for lectures, discussions, &c., on practical and scientific subjects. The great trouble is that Ruralists do not do enough of their own thinking, talking, and writing—but leave such things to their ministers, teachers and editors. They should think, talk and write more for themselves, and in behalf of their own interests—and, next to early education and training, the best way to qualify themselves to do this, is to practice these arts, for each is an art, individually and collectively, at every opportunity, and especially during the long evenings and leisure days of the season of Nature's hibernation. In almost every school district there are men who possess sufficient mind and talent to take the lead in delivering brief lectures, writing essays and discussing useful questions; all that is lacking is the necessary energy to perfect an organization and make a commencement. The start must be made by voluntary effort, and one, two or three persons can secure this, in almost any locality, by proper and timely action.

Farmers live too much within themselves at all times, and are prone to imitate Nature, by going into a torpid or hibernating state during winter, instead of employing it as a season of mental, moral and social improvement for themselves and their families. Rural friends and brethren, you know what we aver is too true, and that other things to which we might allude in the same connection ought not to be as they are, and need amendment. But our present article is merely suggestive, and we will not particularize. Our principal object is to direct your attention to the subject of associated effort, and the means or mode of securing its greatest benefits, in every neighborhood where it is feasible—and we trust that it includes nearly every locality within the large circle of our parish of readers. The plan is not only practical in Western New York, Canada, the Western States, New England and the South—but we think our friends in California, Oregon, New Mexico, Washington Territory, &c., may get together a few kindred spirits, form a Rural Club or Lyceum, and derive decided benefit therefrom. It will pay far better than lounging about corner or village stores or taverns, or staying idly at home smoking and doing or thinking about nothing of any value to yourself or others. (Of course Rural subscribers and readers are not supposed to be addicted to these things, but perchance some persons who are may read or hear this article, and we make the above remark for their special benefit.)

A few pertinent words in this connection to the officers and active members of Agricultural Societies—Town, District and County—already organized and in operation. According to our observation and experience, which has not been very limited, the Annual Fair is not the best time and place to either deliver or properly listen to and comprehend an address calculated to instruct and benefit agriculturists. It is not unfrequently the case on such occasions that the address must be delivered, if at all, at a time or in a position, when and where it cannot be heard and appreciated—the excitement and "noise and confusion" of the surrounding exhibition, or the difficulty of hearing the speaker in the open air (and the

larger the audience the greater the difficulty,) precluding the great mass of spectators from deriving either pleasure or instruction from the discussion of any subject, however important. It is certainly complimentary to the speaker at a Fair to have an audience of from five to ten thousand—as we have had on some occasions—but if he has not the voice and lungs to talk to over one or two thousand in the open air, the great majority can only see him go through the motions, which is simply an aggravation. Now, while we would not entirely condemn the practice of having addresses at Fairs—for they are no doubt prominent attractions in many instances, and therefore beneficial to the Societies pecuniarily—we submit whether it would not be better to reserve the address, or have another, at the Annual meeting, which is usually held in Winter, and to secure a commodious hall or other building where an audience could comfortably hear and comprehend the subject discussed. This course has been adopted successfully by several Town Ag. Associations in Western New York, and we think is worthy the attention of County Societies also, both here and in other States.

—In our opinion every Town Ag. Society or Farmers' Club, should hold meetings as often as once a month during the winter, (and if fortnightly or weekly the better,) for lectures, discussions, &c.,—and many County Associations could do so advantageously. There is home talent enough generally, and where there is not, it will be easy to procure foreign aid of the right stamp.

FARMERS' OUT-BUILDINGS.

As suggested last week, we continue our remarks in answer to those who seek information through our columns on special subjects; this time giving a few notes on Farmers' Out-Buildings. An Out-Door Cellar.

It is unwise to store a large quantity of vegetables in the cellar of the farm-house, even if it is of sufficient capacity. But not one cellar in a thousand is large enough to hold the products of the farm that require storing in a cellar. As we devote more attention to the economical feeding and fattening of stock, the necessity of good root-cellars will be more sensibly felt. Carrots and parsnips, beets, turnips, cabbage, pumpkins, all require cellar-room. Most of these may be buried, but then they are not always accessible when wanted, and when a pit is opened a cellar is then required for storing until they are fed out. To the question asked, whether a farmer who raises roots and feeds them in part to all his stock can get along without a root-cellar, we answer that he can get along without one, though not well. He would find the money and labor expended in making a cellar the best investment he has made for many a year.

A sandy hillside is the very best place for making a cellar, as in this situation good drainage is secured and easy access. There is, however, no difficulty in making a cellar in any place where the water will not lie within four or five feet of the surface. Dig down as far as drainage will allow, throwing the earth back to be used in banking up. If stone is plenty, they are best for the walls. If not plank and posts will answer. A strong ridge-pole is necessary, which may be supported on posts. Plank the roof, and bank up the sides with earth. Cover the roof with straw or leaves, over which place boards or earth to keep it in place. Perhaps some of our readers who have good out-door cellars will give us, in detail, the manner of construction. If not, before long we will describe one made in this vicinity three years ago, and which has been proof against the severe frosts of the last three winters, and every way convenient and useful.

A Farmers' Ice-House.

Ice has long been a luxury enjoyed by the residents of villages and cities, but of late years it has become almost a necessity even to the dwellers in the country, who are compelled to provide the necessary means for saving it over the summer. The farmer must erect his own ice-house, and though this is a very simple matter, some little knowledge is necessary, or experience may teach what might have been much more cheaply learned. That there is considerable desire for information on this subject, just now, we have abundant evidence in the inquiries before us, and as this is the time when such information is needed, we offer no apology for occupying a brief space in our columns with this matter.

Damp and heat are the two great agents of thawing, and the first endeavor must be to counteract these by every means in our power. For the first ventilation is necessary, and for the latter the most non-conducting material available must be used for the house. The old plan of building ice-houses under ground was bad, as it was almost impossible to secure good drainage and sufficient ventilation to arrest the dampness which is sure to exist in all underground rooms or houses. Then the ground is too good a conductor of heat, and

communicates its heat very readily to other bodies, much more so than even the air.

The best place for an ice-house is above ground, on a gravelly subsoil, where good natural drainage can be had, so that the water that forms as the ice melts will pass off freely. The best material is wood, though brick is good enough where it can be obtained more readily than wood. The walls should be made double, by boarding both on the outside and inside of the frame timbers. The space between the inside and outside boards should be filled with some non-conducting material. Charcoal dust is an excellent non-conductor; dry tan-bark, or saw-dust, will do very well, and if neither of these can be procured, straw will answer a very good purpose. Where the natural drainage is not first-rate, drains must be dug and filled up with stones. If left open, the cold air will pass through them very freely, and its place be supplied by warm air from above. Ice keeps best in large masses, and for several reasons. In a large body there is much less surface exposed in proportion to the whole. Melting ice absorbs and renders latent a large amount of heat, so that the thawing of a part helps preserve that which remains. Those who have built ice-houses that failed to furnish a supply all the summer, will find that by simply enlarging the house, say one-third, the additional quantity of ice will be preserved, unless there is some radical defect in its construction, of which they can judge on reading the principles we have presented. A house twelve feet each way on the ground, and eight or ten feet high, is large enough for any family, and even for two or three families, and yet it is as small as we would recommend any one to build, as the cost and trouble is but little more than for a house just large enough, and the supply is certain.

Where the drainage is such that a board floor is not necessary, and we think they are not used in any of our large ice-houses, though in most cases it would be best to lay down a loose floor a few inches from the surface of the ground. If a quantity of brush was first laid down and covered with straw, and the floor put over this, it would make the work complete. If a board floor is not used there should be at least a foot or eighteen inches of straw, but a few inches on the boards will be sufficient. The ice made in the early part of the winter, and that which has been subjected to no change from freezing to thawing, is the best. It should be sawed out in square cakes as uniform in size and thickness as possible. All snow, and ice formed from half-melted snow, should be rejected, as it will not keep. After one layer is put down, the crevices should be filled with pounded ice, and this should be continued until the house is filled, when the whole will freeze into a solid mass. A few inches of straw should be placed between the walls of the house and the ice, and this should be done while the house is being filled. Then cover the whole with a foot or so of straw, and the work is done. An opening must be made in the roof for ventilation.

An apartment can be made in the ice-house for storing meat, butter, &c., during the warm season, and this will be found no small convenience to farmers. For the sake of the family, who often have to procure ice when no men are around, the ice-house should be as near the residence as possible. It may be made of rough boards, and will cost but very little except the labor, or a little taste may be exercised in its construction, so as to give it a very becoming appearance.

CHEESE AND CHEESE-MAKING.

DURING the present volume of the RURAL we have given publicity to several queries, relative to the manufacture of cheese, together with the responses these inquiries called forth from dairymen, and as there seems to be a desire exhibited by many for all the light obtainable on the subject, we condense the following from the report of the "Examining Committee" appointed by the Jefferson Co. Ag. Society. The "platform" of the Committee is thus laid down:—"Rind firm, smooth, impervious; texture compact, like butter, and salted to preserve."

The first dairy visited—and voted "best"—belonged to Mr. C. A. BENJAMIN. Mr. B. has thirty cows; sets the night's milk in a tin vat, inside of a wooden vat; takes off the cream and does not return it; sets at 84°; cuts the curd fine with a curd knife; separates whey by dipping through a linen strainer; scalds (by putting heated water between the vats) gradually to 105° for one and a half hours; amount of salt used is five ounces to ten pounds of curd; puts in press cold; presses twenty-four hours; bandages often eight or nine hours; applies to surface, in curing, weak lye soon after removing from the press; the second day after applications of lye, uses a little grease and rubs once a day after turning.

The second dairy reported is that of STEPHEN HOBBS, Watertown. Mr. H. gives his modes of operation thus:—"Has fifty cows; sets night's milk in a zinc vat; skims in morning and strains the cream

GROUP OF SPANISH MERINO BUCKS.

Above we give a fine representation of a group of five Spanish Merino bucks, bred and owned by Geo. CAMPBELL, of Vermont. These animals are of the old Spanish stock, introduced by Col. HUMPHREYS and Hon. WM. JARVIS. Mr. CAMPBELL is favorably known as a successful breeder of Merinos, and also as an importer of Silesian sheep, and his flock has attained such excellence and celebrity

as to bring him many orders from distant parts of the country. He writes us (under date of Oct. 21,) that he has just shipped twenty-five rams to Buenos Ayres, (being the fourth sale to the same party,) and fifty bucks and ewes of the Silesian Merino breed, to Virginia. Mr. C. has also received and forwarded ten Spanish and Silesian ewes to parties in Texas.

WINTER KILL, OR HEAVING OUT.

THERE are few farmers who have not gained, by actual experience, a knowledge of the meaning of the above terms—few, at any rate, save those whose lot is cast upon a porous soil affording perfect natural drainage. They have seen their winter grain and clover destroyed by the freezing and heaving out to which all heavy soils are more or less liable, and observation has taught them why and how it is so. The cause and process has been concisely explained as follows:—"The soil is pulverized only as deep as the plow runs—some six or eight inches. Below this is a stratum of clay or hard pan, nearly impervious to water. The surface soil becomes saturated, like a sponge, by the autumn rains or melting snows of spring. When the ground is suddenly frozen, the water contained in it crystallizes into ice, the soil is thrown up into epicures or honey combs; and the poor clover roots or wheat plants are thrown from their beds; and, by a few repetitions of the process, left dead upon the field in the spring.

The root of the evil is a saturated soil. Full of water, the frost exerts a tremendous lifting or expansive power upon it, adequate to lift tons of rocks, and totally destructive to the slender roots of grain or grass. If the subsoil is impervious to water, or nearly so, it matters little what the surface may be—we have seen sandy land heave crops almost as bad as clay, but in all cases the upper stratum was filled with water, and the under soil too compact to allow its passage.

The remedy is to remove, by drainage, the water of saturation. Thorough draining with tile does this most perfectly, but surface draining can aid considerably in the work of prevention. Any process keeping the soil porous, so that all surplus moisture readily passes off, will prevent winter kill of grain and clover.

Thorough drainage is a perfect remedy. After applying it to his clayey farm, Mr. JONNARON, of Seneca Co., says:—"Heretofore many acres of wheat were lost on the upland by freezing out, and none would grow on the low land. Now, there is no loss from that cause." Many instances of like character could be brought to show the effect of draining in this respect. Our readers have had such repeatedly brought before them.

Throwing the land into narrow beds when plowing has long been practiced on level clay lands, when sown to wheat, to some degree prevents winter killing. We would commend the practice where tile-draining is too costly, or otherwise inexpedient. In all cases the dead-furrows should be cleared out and kept clean, with good outlet, and sufficient to carry off all the water they may contain.

Many farmers have been looking favorably toward the culture of winter barley. They should remember, however, that it is more easily affected by freezing out than wheat or clover, the roots being naturally of a shorter habit and having less hold upon the soil. Those who have sown this crop should give attention now to this aspect of the case, and remove, as far as practicable, all chance for water remaining on or near the surface.

SHEEP-SHEARINGS.

MESSES EDS.:—Having noticed in the *RURAL* of late several accounts, by different persons, of the weight of fleeces shorn from their sheep, the last clip, I thought I would like to make a few remarks upon the subject, and also send a statement of the result of my last sheep-shearing, which you are at liberty to publish if you see fit.

I think your correspondents, generally, have not been as particular in their statements as they should be, if they wish their readers to form a correct idea of the comparative value of their flocks; for, if our best authorities are correct upon the point that sheep consume food in proportion to their weight of carcass, it is just as necessary to know the actual weight and condition of that carcass, to judge of its real value for producing wool, as it is to know the weight of wool shorn.

If the above be true, a sheep weighing 200 pounds, and shearing six pounds of wool, is worth for wool but one-half as much as a sheep weighing 100 pounds, and shearing the same amount of wool, and, besides that, the wool of small sheep, if free from gum, is usually of a better quality than that of large ones.

My sheep are Spanish Merino, and nearly all from stock selected by myself in Vermont. I have saved all the ewes from this stock for my own use, keeping my flock reduced by selling from my old stock, until now my flock are nearly all pure blood. You see from this that I have not had the opportunity of selecting which I shall have when my flock becomes entirely pure, and, of course, the average is not as large as it would be after taking out some of the lightest shearers.

My flock of ewes numbers 140, including yearlings, and, to show you that I am improving, I will give you a separate table for the yearlings. They were all well washed and in good store condition when sheared, and the wool free from gum.

EWES OVER ONE YEAR OLD.

Average weight of carcass,.....	74 lbs.
" " " " " " " " " " " " " " " "	per lb. of wool, 13-12 oz.
" " " " " " " " " " " " " " " "	Fleece per head, 6-6 1/2 lbs.

YEARLING EWES.

Average weight of carcass,.....	54-55 lbs.
" " " " " " " " " " " " " " " "	per lb. of wool, 8-5 oz.
" " " " " " " " " " " " " " " "	wool per head, 6-12 4-5 oz.

Two yearlings weighing, one 52 lbs., and the other 58 lbs., sheared respectively, 8 1/2 lbs. and 9 5/8 lbs., being about 1 lb. wool to 6 of carcass.

WHOLE FLOCK, INCLUDING YEARLINGS.

Average weight of wool per head,.....	6-9 oz.
" " " " " " " " " " " " " " " "	of carcass per lb. of wool, 12-3 oz.

It should be remembered that my bucks and wethers are not included in the above.

Livonia, N. Y., 1858. JOHN S. BARNOR.

SORGHUM SYRUP.

EDS. RURAL:—If your columns are still open for this subject, you will be likely to have some flattering accounts of sweet success in the manufacture of sugar and molasses from the Chinese Sugar Cane in our State. In this town we have mills in operation that are turning out barrels of splendid syrup. The proprietor of one informs me he can manufacture molasses for the growers of the cane at 14 cents per gallon, and intends to enlarge his facilities and advertise to that effect before another planting season. The syrup is already on sale at our country stores for 50 cents per gallon. And it sells too.

Now, all that is wanting is for the farmer to know before he plants, that he can convert it into the sweet stuff with no more trouble than to grow it and deliver to a mill within a convenient distance, say three or four miles, or even five miles. He will be sure to plant enough to make three or four barrels of syrup—and half an acre is sufficient for this with but an ordinary crop. The seed for that quantity cannot cost more than ten or twelve cents—the cultivation and harvesting is no more than that of Indian corn. The seed, if it ripens, can be turned to good account—is worth at least as much as oats. Much of the seed in this county has spoiled perfectly. The leaves may be cured for winter fodder or fed green. On the whole, the incredulous are beginning to lap Sorghum molasses with a hearty smack, and exclaim, "I did not believe that sugar cane could be successfully grown at the North."

EDS. RURAL:—Judging from the sneering tone of certain communications in your paper in regard to the Sorghum, or Chinese Sugar Cane, I conclude that it has failed to meet the expectations of its cultivators in your State. Here, on the contrary, it has been a splendid success. Nearly every farmer has raised a little, and with the rude, home-made wooden mills to grind the cane and the cook-stove to boil down the juice, the product has been about eight barrels per acre of very fine syrup. Many have also made good sugar from it, while others have failed in this. We shall expect, to export, in a few years, sugar and molasses to you, if, indeed, the crop cannot be grown in New York.—*HAL, Syracuse, De Kalb Co., Ill., 1858.*

CEMENT vs. WOODEN WATER-PIPE.

EDS. RURAL:—As your contributors are mostly strangers to each other, they should receive statements, necessarily brief, with charity, until the whole of the facts are known.

I. B. HOBBS & Co., mistake the motive for comparing a certain pipe to their wooden water pipe in its capacity, and of imperishable materials. "Of course entirely disinterested," say they. No, interested. Not as inventor and manufacturer, but as every farmer should be in the health of his family, and comfort of his domestic animals.

I thank T. C. PETERS for his suggestions in the *RURAL* of Oct. 23d. I have no intention to "mislead," no interest at stake, and far be it from me to deceive. A good cause needs but truth to sustain it.

A few years since, wishing to know the cost of cement pipe, I made similar inquiries to Mr. PETERS, and came to a like conclusion—that it was too expensive. But I have found by using both tile and cement that a pipe, both efficient, durable, and cheap can be made, and that, too, by any one with sufficient common sense to make him a good farmer. I have ever guarded against misleading,

and it is with pleasure that I give the figures to prove the statement, of imperishable materials, costing for the same, twenty-five cents per rod.

First, the tile. They were procured at the factory, less than three miles distant, for \$10 per thousand and the usual discount of ten per cent, costing, including cartage, when laid on the bank of the ditch, only one cent apiece, and thirteen of these will lay one rod. Good water-lime, for twelve shillings per barrel was brought the same distance—the empty barrels fully paying for cartage. At the rate of one part of lime to three parts sand, one barrel of lime is sufficient for twelve rods, and at one-fifth of lime—which I found to be equally good—the cost of materials is even less than twenty-five cents per rod. A larger portion than the latter of lime to sand is never used by one of our most skillful builders. I have made no allowance for sand, as it was found in abundance at the spring. T. C. P. will see, that with tiles not one-half so much cement is needed as in the old-fashioned pipe, and if laid in a little frame, it is as smooth and uniform in size as a 4 by 4 inch scantling, and as likely to resist pressure as any wooden pipe of its size, and two men can make fifteen or twenty rods in a day. Mr. P. will be more successful than many if his wooden pipe, where it is laid in dry ground, does "last one generation, at least," without repairing. He is favored with a large stream of water, but those families dependent upon water brought from a distance, do not think it more pure and healthful for passing slowly through a decaying pipe.

With no motives other than the public good, and to answer many inquiries as to my experience in conducting water, to prompt these statements, I think no candid person will judge me desirous of controversy.

Palmyra, N. Y., 1858.

THE APIARY—WINTERING BEES.

EDS. RURAL:—Wintering bees is the great desideratum, and, I would add, the "ne plus ultra" of keeping, or rather their management in this changing climate. I would be willing to pay a heavy bonus to learn the art or secret of wintering bees successfully in this locality—it would be a fortune in a few years to any one engaged in this rural pursuit.

I have kept bees for some fifteen years or more, and one of my experiences is that I lose from one-fourth to three-fourths, and one year ago last winter four-fifths of all my swarms. It will readily be perceived that increasing my apiary is rather slow business. The fact is that my bees are running out—the common phrase among unsuccessful culturists in this as well as some other departments of rural affairs—but I am one who is not satisfied with the result hitherto, and have studied not a little and desire to study more the cause of my failure and the remedy. I think now that my study has not been entirely in vain respecting the causes or cause of the great destruction of this profitable and industrious insect.

The first cause to mention is the great changes in the temperature of the atmosphere and its effect on the bees. I have known the mercury to rise 40° in the short space of eight hours, viz., from 6° below zero to 34° above, and a change of 25° is of frequent or of almost daily occurrence. This to bees, or similar insects, must be, to say the least, very unfavorable. Bee-keepers have observed that when bees have been confined in the hive for a few days by a low temperature of the air, and then by a change of atmosphere can get out, that they will empty themselves and on returning to the hive are ready like hungry wolves to eat before them—hence they require more honey to winter them than is thought to be necessary by writers on the bee, and many swarms are starved to death simply from the cause of voracious feeding induced by frequent atmospheric changes. Another effect of these atmospheric changes is, that the bees are confined to the hive on chilly days even in the best part of the season for gathering honey, thus diminishing the supply of honey for winter use. Another effect is to chill the young brood and to prevent the development of new bees and thus diminish the numerical strength of the colony and involving extra labor of clearing the combs and preparing for another brood. Again, the chilly days of the late spring months prevent hatching, and consequently swarming is delayed very late, so much so, that the late swarms cannot possibly gather honey enough for their winter store, and starvation is the result. These are some of the causes I think of my failure in managing bees—the remedy is not so easy to find or discover, but I am in hopes to get some hints in the *RURAL* from more experienced hands.

As you like short articles I will close for the present, hoping to allude to the subject again in another communication, for there is material enough for more than one short newspaper article.

Apiary Cottage, Oct. Co., N. Y., 1858.

DOOR-YARD FENCE.

EDS. RURAL:—Permit a subscriber to give, through your valuable paper, an answer to Mr. E. H. WRIGHT'S inquiry concerning the best and cheapest door-yard fence.

I have just performed the ceremony of what disinterested passers-by (whose judgment in regard to beauty and symmetry is beyond question,) call a happy union of Mr. Black Iron with Miss White Plank. They are to be supported in future by Old Red Cedar, the Father of woods in durability.

Mr. WRIGHT, here is a description of just the fence you want, as well as every other gentleman of taste. Take red cedar posts six feet long, four by four, and two by four. Set firmly, eight feet apart, and three feet above ground. Spike on the top of the posts, strips or rails of two-inch pine plank sixteen feet long and three inches wide, so as to project one-half inch each side, and beveling the edges, on top, one inch back. Space off four rods two inches, from centre to centre,—being careful to bring the rods which come on the posts exactly in the centre—bore with a quarter and sixteenth-inch bit. Saw out on the back side of the post, eighteen inches from the top, a block two inches wide, one and one-half inches deep, to receive bottom rail. Saw the bottom rails, from sixteen feet plank, four inches wide, and notch to fit the gain in the posts so as to make a face in

front, bevel each edge one inch back. Dress out strips of board one half inch thick, and one inch wide—to represent a bar of iron—fit one strip to each space between posts, space off and bore as above. Make a half circle of plank ten inches in diameter to bend rods over. Get quarter-inch round iron ten feet long, out in the centre, and bend over the plank, paint rods and half-inch strips black, the balance of the fence white, before putting fence together. When the paint is dry, nail the half-inch strips on the centre of bottom rail. The base board should be one foot wide, beveled and nailed firmly to the posts and along the bottom rail one inch from the top. The corner and gate posts should be ten inches square, with casing, molding and caps, and when finished these posts should be eight inches above the rods. Bore one hole close to corner post on line with the others in the top rail. Take a bent rod and out off one leg so that it will come half way through top rail, put the other leg in hole ten inches from post. Now take a rod four feet and a half long, and bend on a four-inch circle—place one leg in first hole from post and the other in third hole. Now take a rod, place one leg in the second hole and the other in the seventh, and so on. It will be necessary to cut three rods to each small post.

Make the gates like the fence, running a rod, of three eighths iron from corner to corner, with a nut on one end to tighten rod.

As to the cost, any man of ordinary ingenuity can put it up himself, and the cost of the material will be about three dollars per rod.

Middlebury, Conn., Oct., 1858. F. W. CASSWELL.

RURAL MATTERS IN NORTHERN OHIO.

MESSES EDS.:—I do not know how extensively the *RURAL* is taken in Ohio, but I am afraid not enough for the general good of its citizens. It appears to me that we must go out of the State to procure the best family paper, as the *RURAL* is the first sought for among several different papers taken in my family.

Permit me to say a few words for Northern Ohio. We recently returned from our State Fair, held at Sandusky City, which passed off very pleasantly, with a fine display of good stock, but not as many fine cattle as we have seen heretofore at some of our exhibitions, and an excellent display of fine horses. In all other departments the exhibition was fine. Floral Hall, as well as the whole Fair Grounds, gave great credit to the citizens of Sandusky.

A word in regard to the crops in this part. We had a fair crop of wheat, with very light oats and barley, and about one-half the amount of corn that is usually planted. We see the necessity of underdraining this season, which is driving many of our farmers to it. Had our corn and wheat lands been well underdrained this season, we would realize more than enough to pay the cost. I have just completed an underdrain of forty rods with small flat sand stone, set in such shape as to leave a narrow passage at the bottom. Some of the readers of the *RURAL* say that such a drain will answer a better purpose than tile; but would not tile be better on sandy soil? Also, would an underdrain prove effectual laid with small hard heads, thrown promiscuously in clay soil? Is there not danger of its filling? Will some of the readers of the *RURAL* answer? Also, should meadows with smooth bottoms be broken up when the crop begins to fail? Such I discover is the case with some of mine, especially in the driest parts of the field, where it is the best plow land. How can it be brought to in the most profitable manner when your land is sufficiently drained to admit of plowing if necessary? I have a meadow that was broken up and reseeded. The first year it cut two tons per acre; second, one and a half; this year, one ton per acre. What shall I do with it? It is good soil for wheat and corn.

F. R. OTIS.

Maple Grove Farm, Erie Co., Ohio, 1858.

POTATO EXPERIMENT.

EDS. RURAL:—While on a visit to A. WOOLCOOT, Esq., of East Bloomfield, a few days since, he gave me the result of a new mode of cultivating potatoes, as follows:—Last spring he received from a friend one potato, having sixteen eyes, which he cut into as many pieces, and planted one piece in a hill. Each piece grew and threw up one stalk only. When the stalks reached three or four inches above the ground he put the spade under each hill and raised it up so as to let the air underneath, and thus left it to grow. After a few days new tops began to appear, so that each hill produced from three to seven stalks as large and thrifty as was the first. They were cultivated by hilling up after the common manner. I assisted him in digging and weighing. The product from the sixteen eyes, from a common sized potato, was ninety-three pounds—one bushel and a half and three pounds, large sized for the variety. I believe it was of the kind known as Pale Red—propagated by Mr. GOODRICH at Utica, in this State—each hill produced from three to sixteen tubers—the three largest potatoes were in one hill where was placed the smallest piece of seed, and this hill had but three stalks of tops. The yield from each hill was large for the amount of seed. The amount of tops was larger than the average of hills where four times the amount of seed is used. Mr. W. is confident that the raising of the hill and admitting air was the means of the large tops—and he has applied the same process to a part of his ruta bagas and tomatoes, which show a much larger growth than those that were left to grow after the common method.

Wheatland, N. Y., 1858.

COBBLE-STONE BUILDINGS.—Reading in the *RURAL* of the 24th of July, an inquiry in regard to cobble-stone buildings, and seeing no reply from any one, as I have had some experience during the past twelve years, I thought I would give what information I could, in hopes it might benefit some one who may wish to build, especially if they are as green as I was when I commenced. Good coarse lake sand is the best—any clean sand, however, will do, after sifting the same as for brick mortar. One bushel of slacked lime to three bushels of sand, will make good mortar, but I prefer more lime, as it will look whiter. It should be mixed much stiffer than for other stone work.—*A. SUBBINDER, Bedford, Mich., 1858.*

CONDENSED CORRESPONDENCE.

LEMONS IN RENNET.—Will AMELIA please answer through the *RURAL* whether she puts the whole of the lemon in rennet for cheese? Would not the juice of the lemon have a tendency to sour the curd? By so doing she will oblige a constant reader of the *RURAL*.—*LOUISA, Dundee, N. Y., 1858.*

ANOTHER CURE FOR GARROT.—A cow for which I paid \$95 came from her pasture with her udder caked "as hard as a brick." I milked her as well as I could, getting but little milk, it being so thick that I had to pull it out with my fingers. I then made a strong decoction of wormwood, thickened a little with Indian meal and rubbed it in thoroughly with the hand. I repeated it in the morning, getting away all the coagulated milk possible, and at night found my favorite as well as ever.—*R. R. STODDARD, Wethersfield, N. Y., 1858.*

POTATO EXPERIMENT.—The result of an experiment in planting potatoes was exhibited at the Fair of the New London Co. Society, at Norwich, Conn., which possesses some interest. An equal number of sets from the stem and fruit ends were planted separately on the same soil, with the same quantity and kind of manure, and received exactly the same treatment in every degree. The stem ends gave fourteen and one quarter (14 1/4) pounds, while (what are usually called) the fruit ends, yielded only seven and three-quarter (7 3/4) pounds. This includes everything on the roots; the smallest as well as the largest. The variety, Dover.—*O. W. CONN., 1858.*

ABOUT MILLET.—Seeing an inquiry in the *RURAL* of Oct. 23d, about growing millet, I would say to the writer thereof that he managed right, and would have had a good crop if the seed had been good. I got duped the same way last spring. I bought four bushels of millet—enough to sow eight acres. Bag No. 1, was three-fourths millet and one-fourth pigeon grass; while bag No. 2 was three-fourths pigeon grass and one-fourth millet. I got twelve loads from the piece, such as it was. Millet will grow on any kind of land that is clear of water. You can't have the land too deeply plowed, or too rich—the richer, the better it will grow. Yield from one to three tons per acre.—*J. F. HUNTLEY, Illinois, 1858.*

SIDE-HILL AND LEVEL LAND PLOWS.—As I have not seen any reply to the inquiry of my neighbor "A" in regard to side-hill and level land plows, in the *RURAL* of August 14th, I thought I would offer a suggestion or two in replying to his wants. 1st. In regard to "Barnaby's and Moore's Patent" I know nothing. 2d. As to side-hill plowing and side-hill plows I do profess to know something, and by experience, and to which I will briefly remark that I consider Locking's Patent Side-Hill (wood beam) the best in use for clay land. I also consider it very good for level land with one exception, that is, it cuts rather too narrow a furrow. They are to be found at most of our hardware stores. Price, \$7.50 to \$8.00. If neighbor "A" now differs any from my opinions, I will try and convince him if he will but make me a visit during the coming plow season.—*B. Alfred Centre, N. Y., 1858.*

PREVENTION BETTER THAN CURE.—I saw in the *RURAL* of Sept. 25th, an article on breaking heifers, which I consider very inhuman, to say the least of it. Kindness to the animals under our care is always the best. I will give you my way of breaking. Fasten them by the head so that they can't get away, next take up the fore foot on the side that you milk—have a strap with a buckle on one end, and buckle the foot up tight to the fore-arm, so that the heifer can't get her foot to the ground. Doing so, she can't kick if she tries, and does away with the necessity of a man standing, gad in hand, to whip and abuse the poor animal. I have practiced the above way of breaking heifers for the last ten years, and have never known it to fail. As men's wages are high, and timber scarce, I could not afford it. If Mr. S. D. A. will try the above, he will save time, beef, and milk.—*J. F. HUNTLEY, Illinois, Oct., 1858.*

SALT FOR MANURIAL USES.—We are glad to hear of many experiments going to test the value of salt as a manure. Trusting, as we do, in its success, whenever judiciously employed, we would recommend more extended experiments, and a wider list of crops to which it should be applied, believing that it will pay, not only on wheat, but on grass, corn, potatoes, &c. In the hands of thorough farmers the question must soon come to a decision.

Many, no doubt, now fully convinced of its value, are deterred from its use by the cost of the article. By such as are situated near salt works, experiments can be carried on with the "bitterns" or refuse salt and lime gathering on the surface of the boilers. It costs nothing at the works, and large quantities can be had on application. The expense of transportation would be but trifling anywhere along our canals, and we would be glad to learn of extensive experiments through its application. Apply salt to your orchard, farm, and garden crops, and report the result.—*G. W. H. CORTLAND, N. Y., Oct., 1858.*

PROPOLIS, OR BEE-GLUE.—It has been said by the greatest Apiarists of this State, that no modern writer on bees has been able to detect them in the act of gathering this substance, and the reason is, as they suppose, because there are so few bees gathering it. Near my bees there are a few trees called the Balm of Gilead, and during the latter part of July and the month of August, I have frequently seen bees perched upon the branches, collecting a substance resembling propolis, and I am pretty well satisfied that it is. The reason they do not collect it in the month of June, is because the buds of these trees are not formed—the gum being on the buds—but in August I have seen it so thick, that I could get a teaspoonful in a short time. Now, if any one doubts this, they can get a few slips of this tree, and set them in a good spot a short distance from the bees, and if he does not see bees collecting it, then there are no bees, that is if he has twenty or more swarms. A person having one or two swarms, might not see them in the act, as there would be so few collecting it.—*L. A. ASPINWALL, Ireland's Corners, Alb. Co., N. Y.*

Rural Miscellany.

AGRICULTURAL LECTURES, &c.—As we frequently have letters inquiring for the right persons to deliver Addresses and Lectures on Agriculture, &c., it has occurred to us that we might be of service to all parties interested by giving a list of those who are qualified and willing to act in that capacity during the ensuing winter. Therefore, if our readers will aid us in this matter by giving the addresses of gentlemen prepared to enter the arena as lecturers on Rural and kindred subjects, we will ere long give a list containing the information so often desired by friends connected with Ag. Societies and other associations.

—There are among our contributors and correspondents quite a number of persons admirably qualified for lecturing on practical and scientific subjects, but we cannot say whether they will accept invitations. What say Hon. T. C. PETERS of Darien, Maj. Brooks of Wyoming, and a score of others. We suggest that the two gentlemen named be called, for they are eminently capable.

CLEANING SOILS.—An agricultural exchange very truly remarks there is no season of the year when so much can be effected in the way of cleaning the soil from spurious vegetation as in the fall, after the removal of the crops. By scraping the soil and removing the rubbish, a vast quantity of seeds will be removed and destroyed, as well as roots, all of which are too commonly permitted, in the present lax and imperfect system, to remain to annoy the farmer, and perplex the operations of the successive year. Great watchfulness is required to keep down those vegetables which poison and impoverish the soil without returning any profit, and no one who cultivates even a rood of soil, should neglect it. A few hours' labor, and a slight expenditure of cash, will, at this season, effect more than days of effort in the spring will accomplish, even with the most scrupulous care.—Any one who adopts this plan, will at once perceive its advantages.

SORGHUM IN CINCINNATI.—The last issue of the Cincinnati *Gazette* gives an account of the experiments of Col. WARRING (a farmer residing a few miles distant from that city,) with the Chinese Sugar Cane, the results of which we condense as follows:—"On the 20th of last May Col. W. planted between one and one-half and one and three-fourths acres, from which he has finished manufacturing syrup, with a yield of 440 gallons. The cost of refining and clarifying is about nine cents per gallon. With the mill and evaporators used by him, (expense \$300) and employing two men, three boys, and a pair of horses he can readily turn out two barrels of syrup daily. The seed he feeds to hogs, and considers it valuable for its fattening properties; the strappings make excellent provender for milch cows, and they eat it with avidity. For these two purposes he considers this portion of the product fully pays for crushing."

THE HOG TRADE OF THE WEST.—The Cincinnati *Gazette* has an article on the prospects of the traffic in swine during the ensuing packing season, and from the survey of the whole field of production, concludes that the increase of Indiana, Illinois, Iowa, Missouri and Tennessee, will, in the aggregate, range from fifteen to twenty-five per cent. in number without any material decrease or increase from last year in the average weight. Hogs have passed through the summer in good condition. The corn that is now being fed to them is of superior quality—much better than that used last year, and the animals promise to come forward in good order. The conclusion arrived at may be stated in brief, as follows:—1, Very light stocks of old products on the 1st of December. 2, An increased consumption in 1859. 3, No material difference in the average weight as compared with last year. 4, An increase in number, in the total crop of, say twenty per cent.

EXPERIMENTS WITH UNDERDRAINING.—A fair test of the value of underdraining is furnished by the Country Gentleman, in some experiments made and reported by Mr. THOMAS, of Cayuga Co. The land was a medium between a heavy clay and a light loam; the drains were about three feet deep and two rods apart, with tabular tile, two inches in diameter—the cost being 40 cents a rod, or \$32 per acre. The crops grown the present year were corn and spring wheat, and the increased product of each, compared with like crops on the same land undrained, would repay the expense of draining in three years time. What farmer can make a better use of his capital than to expend it in this improvement.

CLEVELAND BEEF IN GOOD REPUTE.—A late issue of the Cleveland *Herald* says the contracts for Beef to supply the British army and navy have been made. Proposals for seven thousand carcasses were advertised for and were awarded as follows: Col. N. M. STANBURY, of Cleveland, three thousand carcasses; CHADWICK & Co., of Chicago, five hundred carcasses, and the balance between ADAMS, of Baltimore, ALBROOK, of Philadelphia, and DOMINION, of Cincinnati. The prices agreed for the Cleveland packed beef are higher than for that packed at either of the other cities. The average price is \$3 less than that of last year. Cleveland thus stands at the head of the United States in the quality of its beef.

POULTRY AND EGGS.—Fowls like the warm southern aspect, where they can huddle together in the sun during the middle of the day. Provide them such a place and plenty of food, such as corn, cob-meal mixed with scalding water, or hot potatoes, with occasional feeds of the flesh of young calves, plucks of sheep, and constant access to pure water, gravel, old mortar, oyster or clam shells, and bones, all broken finely, and they will yield eggs in abundance through the cold weather.

LARGE YIELD.—Mr. B. N. ALLEN, of Greece, in this county, produced the past season 281 bushels of potatoes from 8 bushels of seed. Variety, the Purple Mercer. The potatoes were cut fine—having two to three eyes in a piece—two pieces in each hill. Planted about 10th of June, on light, sandy soil—part of the ground barley stubble, and part clover and timothy sod. Used some six loads of barn-yard manure.

Orchard and Garden.

MULCHING WITH LIVING PLANTS.

Few understand how large an amount of water is given off by plants during their growth. Our attention was particularly called to this subject many years ago, by a fact which we will relate, and since that time, we have been endeavoring to gain information both by observation and reading. We had a strawberry bed, of about fifteen by thirty feet, of which we were proud. The soil was a yellow, sandy, chestnut loam, and we had highly manured and dug it at least eighteen inches deep. The plants were set out in summer about two feet apart, grew well, and made a few runners. The next summer they bore a fair crop, and threw out very strong runners. After enough plants had been formed to stock the ground, the runners were stopped, and in the fall a little coarse manure was thrown over the bed. The next spring this was raked off. In all our experience we never saw strawberry plants make such a vigorous growth. The leaves and leaf stems were of extraordinary size. The plants, though, of course, somewhat irregular, stood about four inches apart. The prospect for fruit was good. One evening, after a warm day, as the earliest berries began to color, we went home and beheld with consternation our fine strawberry bed in ruins. Every plant was laying flat on the ground and wilted. At first we supposed that some unruly horse or cow had gained access to the garden and had been rolling upon it. But, finding no footprints, and learning that we had been visited with no such intruders, we set about to ascertain the cause. Taking a spade we dug down a foot or more, and found the soil as dry as powder. There did not seem to be a particle of moisture in the soil. We then examined the soil of a strawberry bed near by, made in the spring, where there were but few plants to shade the ground, and found it moist. This was also the case with the soil of other parts of the garden. The idea was thus forced upon us that the large amount of foliage was the cause of the dryness of the soil and the wilting of the plants. With a spade we at once dug under about two-thirds of the plants in the bed, leaving them in rows about four or five inches wide with the width of the spade between the rows. A thorough watering was then given, and the space between the rows covered with coarse manure. The wilted plants that remained revived and perfected their fruit. From this experience we got the idea into our head, where it still remains, that shading or mulching the ground with living plants is about as sensible as it would be to mulch it with hot cinders.

At one of our largest nurseries here, around the office, is a well made lawn, green as we can expect a lawn is in this country, even in the hottest and driest days of summer. On this lawn stands a fine hickory and a most beautiful elm—the old natives of the forest, saved from the woodman's axe. We have often the past summer admired the smooth, closely shaven green of this lawn, exposed to a scorching sun of more than 120°, and hastened to enjoy the cool, grateful shade of the elm, where perhaps the thermometer would not reach 90°; and yet under and around these trees the grass was scorched—literally dried up, and the soil on the surface dry as dust. The growing trees had taken the moisture from the soil, and left it, though shaded, much drier than that which was exposed to the sun. These and a score of other facts which we might mention, and many that will no doubt occur to our readers, show that growing plants and trees abstract the moisture from the soil in large quantities, compared with which the slight benefit they afford in the way of shade is of but little account.

Careful experiments have shown that an acre of wheat of thirty bushels of grain with a proper proportion of straw, exhales 4,111 pounds of water per day. An acre of clover that would make two tons of hay passes off through its leaves 8,600 pounds per day. A sun-flower three feet and a half high perspired during twelve hours of a warm day thirty ounces of water. This, it must be recollected, is not a physical evaporation like that which takes place from the soil, but a vital action or perspiration. All our experience and observation having taught us that growing plants of any kind around trees was an evil, but which might be tolerated in some cases, perhaps, we were much surprised to find the following recommendation in a new book on *Pear Culture*, which but for this and a few other blunders, we would cheerfully recommend to our readers:

"CROPPING THE GROUND FOR A MULCH.—A very convenient substitute for litter, and one from which none of the evils noted will result, is an early crop of some of the broad-leaved vegetables. Turnips, beets, and potatoes are valuable in the order they are mentioned for this purpose, and would in most cases repay the labor of cultivating the trees on them. The first two have the additional advantage of penetrating and loosening the soil without bruising the roots of the trees; and by the superior coolness of their leaves to the night air, condense the humidity in currents of atmosphere passing over them, in the shape of dew, which would have fallen upon the plowed field or the dusty road; and thus assist in nourishing the feeble foliage of the newly-planted trees."—*Field's Pear Culture*.

SAMUEL WALKER, of Massachusetts, made a similar mistake, when he recommended "mulching trees with soil," as also did our friend Dr. SYLVANUS when he advised growing strawberries in a mass, that they might form their own mulch. This is an important matter, and we fear much advice has been given calculated to mislead.

ROT IN GRAPES.—I wish to inquire whether the rot or rot which has affected grapes to some extent in this section is the same that has destroyed the crop about Cincinnati. Will friend LONGWORTH, or some other one, give us a description of its workings in their vicinity? I had in my vineyard one vine on which nearly every grape had from one to three and four black spots on, and when a spot made its appearance on or near the stem of a grape it invariably rotted, or wilted, and dropped off, others on the same cluster not affected at the stem, ripened, and the only sign of the disease, was the spots assumed a bright, glossy appearance. Will such grapes do to lay down for winter use?—P. W. CARSWELL, Middlebury, Conn., Oct., 1888.

CARNATION FLOWERED PEACH.

In the *RURAL* of January 9th, we described the principal varieties of *Double Flowering Fruit Trees*, and also gave a very good drawing of the *White Flowering Peach*, which, with the *Double Crimson*, was obtained in China by Mr. FORTUNE, about eight years since. The old *Double Peach* and *Almond* are well known, and deservedly popular. The great value of these new varieties is the striking beauty of their colors—pure white and deep crimson—quite distinct from the pale rose or peach blossom of the old sorts. Flowering side by side, they produce a fine effect, and commend themselves to a place in all ornamental plantations where the climate is not unfavorable to the blossoming of the Peach. Where the peach blossoms are generally killed, they will of course be of no value, unless protected. The flowers of both are semi-double—that is, they have several rows of petals, and show some stamens in the center.

Last year we received intelligence of the flowering of a new Peach, also from China, called the *Camellia Flowered*, and the present year we have another, more beautiful than all, called the *Carnation Flowered*, of which we give an engraving, taken from a colored drawing in the *London Florist*. We have not learned that these new sorts have been introduced into this country, but our enter-

prising nurserymen lose sight of no rare plant of value, and before many years the *Carnation Flowered Peach* will bloom in our gardens.

The *Florist* says:—"In our October number last year, we gave a colored illustration of a charming new Chinese *Camellia Flowered Peach*, a shrub or rather small tree introduced by Mr. FORTUNE, and 'let out' by Mr. GLENDINNING, of the Chiswick Nursery. We now introduce to notice another variety, the stock of which is in the possession of Mr. GLENDINNING. To the *Double White* and *Crimson Peaches* introduced by Mr. FORTUNE, when that gentleman was collecting plants in China for the Horticultural Society, have now therefore been added two others. The new variety, for the flowers are very much larger and more showy, while the plants are equally hardy and cultivable. It will be seen at a glance how very beautiful the kind we now figure is; and we think it must be admitted that wherever early-flowering plants are in demand, these new and charming varieties of Chinese Peach should not be overlooked."

It has been noted as a remarkable fact, in England, that all the new Chinese Flowering Peaches produce two, and in some cases three, fruits from one flower—a circumstance that never occurs in other peaches.

MR. GLASSE'S GARDENING BOOK.

I AM the son of that ever-to-be-lamented lady, good Mrs. GLASSE, whose instructions in cookery have achieved an immortal reputation. Her husband, a pains-taking man, was very fond of his garden, and he used to imitate his wife by collecting good recipes for managing his crops just as she did her kitchen stuff. Like her, my poor father had an aversion to reasons. "Sally," he would say to his wife, (her real name was Molly, but she got the name of Sally in a family where she lived) "never give a reason. People don't want to know why a dish should be cooked; all they care about is to be told how to cook it. Reasons are only fit for lawyers; when people are paid for arguing why then of course they must chop logic, and try to win by help of reasons. But cooks should be taught to do, not to talk. I never knew a talking cook worth her board. And I've a notion it's much the same with gardening. You see what capital crops Tom Moore there, at the end of the Green Lane, always has; and yet he can hardly write his name. But Mr. Samuel up at the Hall, who is quite a scholar, calls things by Latin names, and is never done with talking, and whose wall trees are beautifully cut, according to what he calls principle, has not half so much. I've learnt many things from Tom, and uncommon good advice he gives; but never a reason. One day he said to me, 'Mind you sow that Early Corn seed this week'; and when I asked him whether the week wouldn't do as well, 'No,' says he, 'it won't. I tell you so now it this week.' But I didn't, for I thought a few days couldn't signify, and I hadn't half a crop, which was very late, too, and Tom had a full crop; so for pulling, very near three weeks sooner. And so I think Tom the best gardener of the two."

Many and many a year did my father work at his garden; and when plenty of money came in from the bookellers, (he used to call my mother's book his cow), he got a bigger piece of ground, and grew flowers, and built a Vinery or two, and at last got up a long brick pit in which he grew Pine Apples. I shall never forget the old gentleman's joy when he came back from the show at Hinton, where he beat Mr. Samuel with Pine Apples and Celery. "There," he said, smoothing down his chin with his right hand, "that comes of doing and not chattering, (he was a little lively that evening.) Never, my boy, trouble yourself to know why one way is better than another. Find out by experience which is the best way and do that. There's nothing like experience. When

you walk you don't want to know the reason why you can stand upright, and get along with one leg following the other; if you did want to know you wouldn't find out. So I say with gardening. Isaac Ker was the best Pine grower in our county; and nobody's Celery was as fine as Tom Moore's. Isaac showed me how to do as he did, and Tom did the same. I never asked a question, but did as they did, and now, lad, I've won—I've won—against all Mr. Samuel's book learning."

The old gentleman was all his life collecting gardening recipes. He tried as many as he could, and when they didn't answer, he scratched them out of his book; for he had a large book in which he wrote them—it had been the ledger of a smart young general shopkeeper in our village, who broke before he had time to put anything into it. When the recipes turned out right he marked a cross against them. When he couldn't try them he used in an evening in winter to talk about them to Isaac and Tom at their smoking club, which met once a month; and mended them or threw them away, according as the recipes agreed, or didn't agree, with their practice. And so, in course of time, an amazing quantity of things were jotted down. He even used to get some things from mother, because, as he said, "if Sally should be called away from me, I shan't know her ways of cooking, and pickling, and preserving, and dishing up the things when they are grown; and it's no use to grow things if one don't know how to make them fit to eat."

It is a good many years now since father died, and I have looked about in gardens to see what was going on, without learning much, except about new plants and the way of growing them. And the more I see, and the longer I live, the more I am sure that father was right in his ways. I see good plain plodding men, not great scholars, managing well, without expense that is not wanted; and I see others with their mouth full of fine words, talking of picturesque and gardenesque, and lines of beauty, and giving Latin names to weeds, and shaking their wise heads over chemistry, and geology, and meteorology, who can't get a decent crop out of a kitchen garden or orchard. So I am thinking that father's recipes may be of use to others as they were to him; and with your approval I will send you some every now and then. Only you must mind that they remain my own property, and are not to be made into a book by you or anybody else, without my leave. As I don't wish to hide my name, I subscribe myself *PETER GLASSE, Little Okeley*.

1. *How to lay Turf in Dry Weather*.—Make the ground firm, level, and level. Bake off all the stones. Sift over the ground some fine burnt clay. If you can get it sift over that the dust of oil-cake, or some malt comings, or just a little guano; half a pound to a rod is plenty for guano. Give a good watering. Then lay down the turf as fast as you can, beat it well, and then leave it alone. It will get hold directly.

2. *How to get Autumn Radishes*.—Sow the seed of the Early White or Crimson Turnip at the end of August or in the first week of September. Choose a nice warm border and a light damp soil. They will be ready in October. If you want to keep them in November, strip off their leaves, and pack in dry sand.

3. *How to save Sweet Herbs*.—Gather Sage, Marjoram, Basil, Savory, Thyme, and such things, any time in September. Tie them in small bunches with strings having a loop. Hang them by the heels to a wall in a dry place, such as shed or out-house, where there is a thorough draft and no sun; the faster they are dried the better they are, provided the sun does not shine on them. When dry, hang them up in a dry room. If put into bags, mind they are not made of brown paper.

4. *How to Kill Wasps*.—Find their holes. In the evening pour in a little turpentine if you can. If the holes are very small, push in some fine slivered turpentine. If both these fail, put a turf or clod in the hole and stamp it well down. Another way:—Gas tar will do as well. P. G. (When I put "P. G." the recipe is mine, and not my father's.)

5. *How to strike China Roses from Cuttings*.—In the beginning of September get some pretty ripe shoots. You may know whether they are ripe enough, by the lower leaves coming off easily. Cut the shoots into pieces eight or nine inches long. With a sharp knife cut the lower end straight across, leaving a bud; draw the knife from the bud, not towards it; cut the upper end slanting, just above the bud. Leave on the two uppermost leaves. Pull off all the others. Take a pot about eight inches deep. Put a few crocks in the bottom; over the crocks lay some old shreds, and then an inch of charcoal dust, or silver sand; fill up with one-quarter peat and half loam. With a round stick make holes through the peat and loam down to the charcoal. Put in the cuttings so as to leave the two leaves above ground, and press the soil down firmly. Give a watering with rain water. Then plunge the pot on a mild hot bed, or set in any warm place where it may be kept damp; put a hand-glass over and keep the soil off until the cuttings begin to push. Then give a little air, at night, putting the hand glass on again in the day time. They will soon strike roots. Another way:—You may place the pots when filled with cuttings, in a shady border, with or without hand-glasses, and they will strike in time. But the first is the quickest way.

6. *How to Save Leaves in Winter*.—Sweep them up when dry. Keep the oak leaves by themselves, if you can; for they don't make such good leaf-mould as others. Burn fir leaves. Keep the leaves as dry as you can, by packing them close in dry weather against your pit, if you want the leaves to keep the frost out; and put over them a sloping roof of mats or old boards, or something of that kind. So managed they will keep off very bad cold. If they get very wet they are not of much use. If you don't want them for pits put them into a shed. You may get some early Seakale or Rhubarb by burying the old roots among dry leaves. When the winter is over, and you want a little bottom-heat for your frames, leaves are useful for mixing with stable litter. Half and half is not too much. A cucumber bed made so will give a nice mild heat. What leaves you don't want for this, should be thrown up out-of-doors for the summer, to take their chance, and by the autumn all except the oak leaves will be crumbled to powder, and make famous leaf-mould. But they should be turned over two or three times during the summer.

7. *How to keep Grains over the Winter*.—Take them up on a dry day. Knock all the mould off their roots. Shorten them down to two or three joints. Lay in the sun for a few hours if you can. Mind there are no leaves on them. Have ready some quite dry pit (not sea sand). Bury them four inches deep in the sand, the roots downwards. Keep them dry all winter; you may do that in a good old frame which does not drip. Fine coal ashes will do as well as pit sand. If you have convenience for keeping frost out you need not bury them, but may keep the ends out of the sand.

8. *How to Prune Fruit Trees in Autumn*.—Let them alone.

9. *How to Keep Ants off Fruit*.—Sprinkle their runs with turpentine. Another way:—Draw a ring an inch wide, with gas tar, round the stem, six inches above the ground, if the ants get up by the stem. Another way:—Put guano in their runs. I think this is best.—P. G.

10. *How to Pickle Brerries for Garnishing*.—Let them be quite red and dry, but not soft or over ripe. Take a pickle jar; pack it full of bunches without pressing them. Fill it up with good cold vinegar. Add a little salt. Tie down with a bladder. These will keep till March.—*London Gardeners' Chronicle*.

Domestic Economy.

COLORING RECIPES—PUDDINGS AND CAKES.

COLORING COCHINEAL SCARLET.—Heat sufficient water to cover one pound of woollen cloth or yarn in a clean brass kettle; put in one-half ounce cream of tartar; pulverize one ounce of cochineal and add thereto. Scald and strain—set it back, put in 2 ounces spirits of tin, stir well, wet your cloth in clean water, wring dry, put it in the dye and let it remain one hour, airing it. This colors a bright scarlet. If you wish to have it darker, dip it in strong alum water.

COLORING BLUE ON COTTON.—Dissolve 7 ounces copperas in sufficient warm water to cover 3 pounds of cloth, put in your cloth and let it remain 1 hour, airing it; take it out and rinse in two clean waters. Dissolve 1 ounce of prussiate of potash in the same quantity of water, and add 1 spoonful oil of vitriol—stir it well, put in the cloth and let it remain 1 hour, airing it, then rinse in two clean waters.

COLORING RED ON COTTON.—One pound of camwood—bottled in an iron kettle—will color three or four pounds of cotton cloth a light red, that will not fade. By letting it remain in the dye a day or two, it will color darker, airing and heating it occasionally.

BREAD PUDDING.—One quart sweet milk; 2 eggs; 1 cup sugar; 1 cup of butter; 1 nutmeg—thicken the whole with bread, chopped fine; 1 cup raisins.

RICE PUDDING.—Tie up in a bag 1 cup of rice; 1 cup raisins; put the whole into a kettle of boiling water and boil.

SAUCE FOR PUDDINGS.—Melt 1 cup of sugar, add to it 1 cup of butter; 1 cup of brandy; 1 nutmeg—serve hot.

COB CAKE.—One cup of butter; 2 cups of sugar; 3 cups of flour, and four eggs.

SPONGE CAKE.—Four eggs; 2 cups of sugar; 2 cups of flour.

COOKIES.—One cup of sugar, rolled fine; 1 cup of butter; 1 cup of sour milk, and 1 teaspoonful saleratus.

LOAF CAKE.—One cup butter; 2 of sugar; 3 of dough; 4 eggs. LOUISA.

Kirtland, Ohio, 1888.

TO COLOR A BRIGHT BLUE.—Having noticed an inquiry in the *RURAL*, from MOLLIE, as to the mode of coloring bright blue, I will give her our method. For silk or cotton, take a piece of prussiate of potash half the size of a walnut; half an ounce of copperas; dissolve in three pints soft water, then add eight or ten drops of oil of vitriol. When scalding (not boiling) hot, dip your cloth in, wet it thoroughly with the dye, and wring out as soon as possible—when dry, rinse in cold water. For flannel or silk take the compound of vitriol and indigo, (which can be found at any druggists) stir thoroughly into soft boiling water, according to the shade you desire, set with a little alum. A beautiful green may be obtained by adding the same compound to a strong yellow dye set with alum.—EMMA M., Smithfield, Mad. Co., N. Y., 1888.

GRAPE PRESERVES AND FRUIT CAKE.—Take ripe grapes, squeeze out the pulp and put them in a preserving kettle; let them boil gently a few minutes, then strain through a colander. Take white sugar, equal portions, with pulp and skins, and cook until done. Skim the grapes out and simmer the syrup until sufficient thickness to keep.

FRUIT CAKE.—One and one-fourth pound sugar; 1 pound flour; 1 pound butter; 1 pound currants; 1 pound raisins; 1 pound citron; 1 teaspoon saleratus; 2 teaspoons sour milk; 8 eggs, beat the whites and yolks separate; 1 teaspoon jelly; cloves, cinnamon, nutmeg, and a small piece of lard.—LOUISA, Dundee, N. Y., 1888.

COOKING SALT WHITE FISH—DRAWN BUTTER.—Soak the fish over night, then boil it in equal quantities of milk and water—have ready a little drawn butter, pour it over the fish, and send it to the table while hot.

DRAWN BUTTER.—Take a piece of butter the size of an egg, melt it, mix a little flour with half of a teaspoon of cream, and stir it with the butter until it boils.—MARY C., Hannibal Centre, Oswego Co., N. Y., 1888.

RECIPE FOR STEAMED PUDDING.—Pare and quarter six or seven apples, then slice them in a dish. To one pint of flour, take a small bit of shortening and one teaspoonful of "Merrill's Yeast Powder"; roll thick and lay over the apples. Steam two hours without lifting the lid of the steamer. Eat with sweet sauce or wine sauce. If this does not please Mr. SYLVANUS, of Burlington, N. Y., I should quite despair of doing so.—JESSE Rochester, 1868.

A STEAMED APPLE PUDDING.—Take some apples, pare and slice thin, place in a small pan, with water enough to cook, then take a piece of butter as large as an egg, work in the flour, then add 2 cups of buttermilk; 1 of milk; teaspoon soda. Spread this over the apples, then place over it another pan, put on the stove, cook till done, serve with cream and sugar. If your landlady does not succeed, if you will come, "cop in hand," I think I can give you one that will.—A READER.

APPLE DUMPLINGS.—Mix a paste as if for biscuit or short cake; butter a two quart basin; lay the paste around the sides, but have none at the bottom; fill it with good greenings or pippins, quartered; season with salt; a teaspoon of water; cover the top with paste; put in the oven and bake till done, then put on butter, sugar, and cream, with nutmeg grated over the top.—AUNT MOLLY, Waverly, Pa., 1888.

SPONGE GINGERBREAD.—Take half a cup of melted butter; 1 tablespoonful of ginger; 1 pint of molasses; stir in flour to make it thick, then add 1 pint of sweet milk; 1 tablespoonful saleratus; flour enough to roll—bake in a quick oven.—ALLIE B., Holley, N. Y., 1888.

NICE ROSE.—One coffee-cup of sugar; 1 of milk; 1 teaspoon of yeast; butter size of an egg; 2 eggs beat all together—add flour.—C. E. E., Benton Centre, Yates Co., N. Y., 1888.

Ladies' Port-Folio.

A HOME SCENE.

Come, let us put the curtain down,
And lay the work aside,
And gather up the playthings
That you've scattered far and wide;
And place the lamp upon the stand,
Beside the great arm-chair,
And bring the last new magazine,
And cut the leaves with care:

Now heap some coal upon the grate—
He loves a cheerful fire—
See how the flames dance merrily,
And leap up high and higher!
Now place his slippers on the rug,
And get his dressing-gown;
For Papa will be tired and cold,
When he comes home from town.

Come let me bathe your glowing cheeks,
And make your hair look neat,
And put your bright pink apron on:
There, now! you're clean and sweet!
Now sit down on the little bench
That Grand-pa made, and see
How still you'll be while Mama
Goes to lay the cloth for tea.

The tea-kettle sends forth its hum,
The biscuits are so light:
I wish he'd come, it seems to me
He's rather late to-night!
Hark! I wasn't that our gate that clicked?
Burrah! shouts little Will;
And ere I've time to tell him, hush!
He's bounded o'er the sill.

And "Papa's come!" he shouts again,
And climbs up for a kiss;
And "Papa's tum, Oh! Papa's tum!"
Echoes his little Sis.
Oh, happy group, that live and love
Within that humble cot:
Many who dwell in palaces
Might envy them their lot.

Written for Moore's Rural New-Yorker.

MUSIC.

MARTIN LUTHER said of Music, "It is one of the fairest and most glorious gifts of God, to which SATAN is a bitter enemy; for it removes from the heart the weight of sorrows and the fascination of evil thoughts. Music is a kind and gentle sort of discipline; it refines the passions and improves the understanding." There is nothing which rules so powerfully, and yet so gently over us, as the soothing strains of music. If the heart is full to overflowing with joy and gladness, it bursts forth in song—if the heavy hand of affliction is laid upon us, and all seems dark around, a song may dispel the clouds in the heart's horizon. Under whatever circumstances it is heard, it awakens high and lofty emotions. Long years ago, when earth was young and clad in robes of virgin beauty, the "morning stars sang together." When the children of Israel beheld "PHARAOH and his hosts destroyed in the Red Sea, they sang a song of praise to the Lord for his great goodness in that he had delivered them from the power of the Egyptians. Angels proclaimed the advent of the SAVIOR to the humble shepherds on the plains of Judea, and the high arches of heaven echoed to their songs of praise.

Patmos, beheld in a vision, "a great multitude which no man can number," who stood forever before the Eternal Throne and sang the praises of Him who sitteth upon it. Thus does music come down to us through the long lapse of ages hallowed with sacred associations. It is listened to by the rich and powerful, or by the humble peasant in his lowly cot. This free to all—free as the air of heaven.

Stand in Nature's grand cathedral. The foundations thereof were laid centuries ago—the ceiling is the star-studded dome of heaven. The Architect and Builder was Omnipotence; He reared that structure which shall stand when the domes and minarets of St. Peter's have crumbled to dust, and those who raised those lofty columns shall have taken up their abode in the "marble halls of Death." Listen to the soul thrilling music that echoes through the lofty corridors and down the lengthened aisles—the "wild, profound, eternal bass" as heard in the roar of ocean when the Storm King reigns—the low sighing of the evening breeze coming as it were from the gates of paradise, telling of a land fairer than sun or moon ever shone upon, whose beauties mortal eyes never beheld, of whose joys mortal ears never heard. The anthem of praise shall never cease to resound through the noble structure, till the Apocalyptic Angel shall stand and swear by Him that reigneth forever, that Time shall be no more.

But there is a harp whose "thousand strings" once touched will never cease to vibrate—they will tremble and quiver long after the hand that struck them shall have mouldered in the grave. Ye who engage in the great work of teaching, remember that it is your high-born privilege to call forth the sweetest strains of music from those golden chords; or, should you strike them with a careless hand, awaken harsh discords either of which shall echo to the last moment of recorded time, and long as the ages of eternity shall roll. Oh, then, go forth, and labor faithfully in the great moral vineyard of the earth, and when the Master shall call in his laborers at the evening hour of life, your reward shall be the smiles of an approving God and a conscience at peace with its Maker—what more could you desire? What nobler employment could you ask for than that of leading immortal minds to the fountain of knowledge, of fitting them for a life of usefulness here on earth and a life of peace and rest beyond "death's swelling flood." The poet has most beautifully sung,

"Our hearts beat stout and brave,
Still like muffled drums are beating
Funeral marches to the grave."

Every throb of the heart tells us that we are passing away. The soul beats wildly against its prison walls of clay, and struggles to be free; soon the bars of life shall break; our hearts shall have beat the last "march" and then, only then, may we strike the golden harp of heaven and wake the echoes of eternity with a ceaseless song of praise.

Medina, N. Y., 1868.

If we reprove or chastise before we feel a painful regret on account of the necessity for it, the proper season for doing it has not yet arrived.

HOPOLOGY, CONTINUED.

I HAVE been anxiously looking for the reply to the query, "I wonder if AMELIA wears hoops!"—and here it comes in the paper to-day. Greatly to my disappointment she does not. And why? "Because she thinks the fashion one of the most ridiculous the world has ever seen." Now I profess to be by nature and practice one of the most patient of my sex, but here I confess to feeling my righteous indignation thoroughly aroused. It is just as absurd to ridicule and deprecate a style of dress simply because it is the fashion, as it is to adopt an extravagance for the same reason. Every ignorant and brainless scribbler, who has reached the position of editor to a petty newspaper, every rowdy upon the street corners, has had his vulgar fling at hoops. Jest innumerable have been uttered and chronicled at their expense, and laughed at by high and low. Yet all the time sensible people, who have bestowed any thought upon the subject, have been convinced of the real value and utility of these much abused hoops. Take up any book on physiology, read any of the thousand treatises on health especially addressed to women, and uniformly you will find the heat and pressure of heavy skirts denounced as the cause of nine-tenths of the cases of weakness and disease. Very few women who have given the subject any attention have failed to notice this in their own cases. A great many expedients have been suggested by women who have devoted themselves to the matter of reform in dress, for obviating this, but none so effectual as the use of hoops. "AMELIA" may say she does not burden herself in such a manner, but if she would not consider herself contaminated by the experiment, I would earnestly request her to wear for one day the interdicted hoops, and then see if in their absence she is not sensible of a wearisome burden she had not before noticed. Mind, I do not request that, "if she be tall, she shall make herself resemble a hoghead, or if short, a jug," but "let your moderation be known" by following a good fashion without abusing it. Everything may be made absurd by carrying to extremes, but that is no argument against it. In conclusion, I will give my experience by saying, that after the trial of hoops for two years I find them in every way comfortable, agreeable and healthful—that after traveling more than two thousand miles by railroad in them, I have never found them inconvenient, and that it is my fixed purpose never to abandon them for sneers, or ridicule, or change of fashion.

MARRIAGES.

MUCH has been said in England regarding the falling off in the number of marriages. Persons who took this view of the question based their opinions upon insufficient evidence. They found that in certain classes of marriages there was a falling off, and they concluded rather hastily that there must be a similar falling off in other classes. Recent returns show that the price of provisions influences very greatly the marriages among the lower classes, but there are no grounds for the assertion that the marriage market is in reality falling into decay in any class of the population of England. The London Times, in speaking of this subject, holds the following language, which is equally applicable to certain classes in this country:

The only truth with which the argument was tinged was this, that in a certain class, where the education and habits generally acquired are considerably above the pecuniary competence usually possessed, there does appear a growing difficulty in making matches in sufficient number. The class in question, which would be found in the upper levels of the great middle order of society, is not large enough to affect the returns of the whole nation, but it is one in which there is much activity of tongue and pen, and where any derangement attracts a good deal of attention. The people comprised in it are eminently writing and talking people, and they talk and write of what comes home most forcibly to themselves. They are also people of no small influence, and for this, as well as for general reasons, it is much to be wished that the anomaly could be removed. A young lady of this class has not a fair chance of getting comfortably married, but the fault and the remedy can be both indicated in a moment. Mothers must not expect for their daughters at the age of 21 such an establishment as they enjoy themselves after 30 years of matrimony. Neither professions nor fortunes can be obtained full-grown. The mistake lies in the endeavor to reproduce the parent establishment on its full scale in the case of each child at its first settlement, just if a landholder with £3,000 a year were to expect that every one of his daughters should enter by marriage upon exactly such a property. Fathers should remember that their elevation came by degrees; sons that they have naturally the same probability to go through; and mothers, that what they have now they had not when they began. To the daughters we say nothing, for the fault is rarely theirs; but the whole evil would vanish at once if it were but openly acknowledged that people might move on the same social level with broad distinctions of living and means.

A MOST EXCELLENT THING IN WOMAN.—There is one part of a woman's education often forgotten or neglected—the culture and formation of a gentle voice. It is a great gift of nature, to be aided by culture—an instrument of powerful influence for good. I speak not of singing hymns now, and the culture of harmony and musical purposes, though these tend to God's praise, or to give innocent amusement; but this gentle voice will be able to guide and persuade to good the manly heart of a faithful husband, will mitigate sorrow, lessen trial, and speak of hope and joy to her dearest friends and connections in accents at once powerful and pleasing. Let us then be careful in our schools to cultivate this most valuable acquirement. How different, in all respects, to a family, for friends and neighbors, are the kind, gentle, persuasive accents I have described, from sounds we sometimes (alas! too often) hear in the close abodes of poverty and trial—high, harsh, female treble tones of bitter import, scolding and reproaching, and driving away from the hearth and home (perhaps to sorrow and to sin) the husband and the children.

Choice Miscellany.

MEMORY'S PICTURES.

As oft, when dreamy thoughts arise,
Life's traveled path we trace,
How bright and sunny seem the skies
That crown our loved birth-place.
The childhood home—the joyous hearth—
The friends who gathered there—
The merry song and cheerful mirth
Are pictures bright and fair.

Yet, as we fill the pleasing cup
Which Memory has portrayed,
Dark drops of sadness, mingling up,
Present a deeper shade.
A brother—long by love endeared
With hopes both bright and gay—
Death's cold and chilling hand hath grasped,
And torn from life away.

A sister, too, perchance is laid
Beneath the chilling sod,
And hearts, with whom in youth we played,
Are jewels now with God.
A mother, or, perchance, a sire,
Is sleeping in the tomb;
Put out affection's sacred fire,
And perished manhood's bloom.

Yet still around the faithful heart
Those cherished ties will twine,
And death alone can rend apart
The friends of "Auld lang syne;"
And memory oft will bring again
That happy, bright birth-place,
Those days of pleasure or of pain,
Oh, time can ne'er efface.

Somerset, N. Y., 1868.

W. C. W.

NEWSPAPERS.

NEWSPAPERS form a large share of the reading of the present day. They grace the public hall as well as the private sitting-room, reminding us of a social friend that greets us everywhere, telling us the news, spiced with mirth if we are merry, and condolence if we are sad. All find there something to amuse or instruct. When

"The lamps are all lit in the parlor,
Add stars in the calm azure sky,"
then, seated by the cheerful fire, with the last copy of the RURAL, or Tribune, the farmer looks first at the column where he can ascertain the price of wheat, and, as he reads that it is falling, his brow assumes a shade of care, for he fears that another year he must remain debtor for his quiet cottage home. But little MARY, his pride and pet, whispers gently, "You need get me no Christmas gifts, father;" she has noticed his sadness, and conjectured the cause. Then, lovingly, he strokes her hair, and wonders if there is another MARY like his in the wide world.

Grandma, too, wipes her spectacles, and takes the paper to examine it, for she wishes to know what ships have arrived in port. But she finds not the name of the long looked-for vessel, and again she settles her glasses and sits by the fire, seemingly watching the fabled blaze. Is she thinking of the glowing embers? No. Tears fill her aged eyes as she remembers an erring one that left his childhood's home; to speak his fortune on the rolling sea. "Twas a noble ship that bore him over the proud waters, but it never came back. Still that aged mother sits not in looking for his return.

Now, WILL, it may be, reads aloud concerning the wars and turmoil in Kansas, and largely expatiates upon the bravery he would manifest were he only there, forgetting the hasty retreat he makes if his light is suddenly extinguished when exploring some unknown nook in the cellar—especially if we have been telling ghost stories.

At last, we take the paper, after politics and the propriety of annexing New Zealand to the United States have been discussed, to examine the list of marriages and deaths. We see there the name of an old school-mate, Judge B—. Then we, too, look sober, and say, "Well, I hope he is married happily," only we cannot help remembering those moonlight rides on his gaily-painted sled, when we were children, and of the apple paring that, after being swung over the head three times, always made such a capital B. Then we notice a marriage that is recorded with many flourishes and much ado, the editor not forgetting to mention having received a beautiful loaf of cake. For a moment we are almost astonished. Can it be our old friend and teacher, Mr. C.—? Why, we did not suppose he knew there was such a word as *love* in the language. Ah! yes, we do remember once that the word occurred in our parsing lesson, we asked him if it was a proper noun. He instantly answered *no*. Is it common, then, we queried; with a long drawn sigh he answered "yes." But he had not then learned to love the little gipsy of a girl who sat at the foot of the class, who was ever making mistakes purposely. For she it was who had taken possession of his heart. Next we notice the elevation of one to the Presidential Chair, whom can only remember as a flaxen-haired boy at school, who was ever writing anonymous love letters, as he called them, with his name in full at the bottom of the sheet. I wonder if he ever thinks of those delicate little missives, written on sky-blue paper, perfumed with peppermint, as he is dispatching letters of vast import? Then we glance at the record of deaths, hoping that we may see no familiar names, but "MARTIN" stands out before us. We hope, in our selfish love, it may not be the MARTIN we love, but it is MARTIN LEE. Then tears blind our eyes as we think of hearts now made lonely, for she was the sunshine that gladdened many a one. Yes, deep, indeed, would be the anguish of the mother at the hour of eve, when she was wont to hear her darling nap, in childish accents, love to our Father in Heaven, were it not that she knows MARTIN has passed through the pearly gates unto the Celestial City, and is ever near the SAVIOR with her golden harp. Another name arrests our attention, FLORE R—. Years ago they bore her to the sunny climes of Italy, hoping to tempt the rose tint once more to her cheek. But she tired of the gay scenes, and longed again for her quiet cottage home, there to fold her eyes in sleep, and join the ransomed throng. Ah, now I remember a tiny note laid among my treasures. Within its folds there is a faded violet, reminding me of a promise made, long ago, to plant violets over her grave. Surely I will remember the promise, and then, too, my gentle friend.

Wyoming, N. Y., 1868.

JANET.

DRESS MAKES THE MAN.

DON'T tell me that *worth* makes the man. I know better, and so do you. If this were true, why do we see true merit left to pine by the wayside, and honest worth kicked into the ditch, because, forsooth, TIM TAILOR has not expended his skill upon their persons, and got a hundred or two booked against them—to stay for a season?

Worth makes the man—a pretty story truly!—Then why is that worthy young mechanic—who acquired a superior education while serving as an apprentice, and who now, from his small salary, supports his widowed mother, and young brothers and sisters—left to struggle on without a word of sympathy or encouragement, and literally looked down upon with contempt? And ALICE DRAKE, too, the sweet little dress-maker, who is better educated, has far more sense, and a nobler soul, than nine-tenths of her employers, and yet what is she? Nothing but a sewing-girl, to be sure.

No, no; it's *dress* that makes the man. No matter if but one idea burdens his beaver-crested cranium—no matter if he does have to dodge at the corner of every street to escape the repeated duns of merchant tailors and haberdashers. What if his taper fingers could not legibly trace his high-sounding name—or what if they should happen to slip into their neighbor's pocket, and get entangled in his purse—so long as his kinks are of the newest style, and his coat fits to a T, and is renewed every month; while his perfumed locks emit their delectable odor, and his mustache is of the exact trim; while he can smile, and flatter, and talk agreeable nonsense from dewy morn till evening's sombre hour. Dress makes the man. We have woman's testimony on our side—one-half of whom would not deign to notice worth in humble garb, but would spend any number of golden moments to gain the smiles and flattery of that soulless bundle of hair, broadcloth and cigars, who quaffs his morning dram at some fashionable saloon, twirls his cane, and bows *a la Parisian*. No, no; dress makes the man—the ladies say so, and every body says so. Miss PRINCE added her testimony when she discharged PLINY PLANE, with whose virtues she had been acquainted from childhood, and married LEOPOLD LILLYBROOK, the mustached foreigner, after an evening's acquaintance; and who absconded ere the honey-moon had waned, after relieving her of money, and her jewels—his bridal gift.

"Worth makes the man" the poet cries,
And yet, we know the poet lies;
For 'tis dress that does the deed,
A tinsel'd garb is all we need."

Cleveland, N. Y., 1868.

GERTRUDE GRAY.

TOO LATE.

THERE is a certain class of persons, who, from the cradle to the grave, have but one prominent characteristic, and that might be expressed in the few words—always too late. Unfortunately for them they seem to have been born an hour or two behind time; and, do the best they can, scotch, hurry, and drive, they never do "catch up." It matters not what they propose to do or where they propose to go, one thing is certain—they will surely be too late. Such people never succeed in anything which they undertake; the death-bell tolls their hopes and expectations is forever pealing—too late. The booming cannon sounds, the plank is drawn, and the huge steamer heaves out into the broad blue ocean just as Monsieur Too Late, bag and baggage, reaches the wharf. The iron lungs of the fierce old locomotive shriek out the sharp whistle and the massive train goes leaping off just as the poor unfortunate gets in sight. The lumbering stage-coach is climbing the hill a quarter of a mile away, and his eager call fails to reach the ear of the boisterous post-boy. The pious exhorter has reached his "sixtieth" before our friend Tardy reaches the long drawn aisles, and all he hears is just enough to pronounce his doom—"the harvest is past, the summer is ended, and ye are not saved." Such a man can never succeed; *too late* is the fatal curse which seals his life a miserable failure. Had he been in time his life might have been a destiny fraught with blessing. Better be an hour too soon than five minutes too late; better go too fast than too slow; better wait for others than let others wait for you; better say now than by-and-by; better wear out than rust out; better pay your subscription in advance than not at all; better let your epitaph be too soon than too late.—*Chattanooga Advocate*.

PUNCTUALITY.—This is one of the most beautiful traits in one's character, and not only adds to a person's estimation in the minds of others, but is ever a source of great advantage to the one possessing it. Those unaccustomed to be punctual, and to perform their duties with promptness, are forever in the drag. By their tardiness at the commencement of the day, they are just so much behind all during it; which, taken in connection with the accumulation of losses from the force of the habit during the day, results, at the close of it, in the loss of much precious time; and if continued through life, in the frustrating of many plans, and the blighting of many fond hopes, and too frequently, is a clog to the progress of many who are dependent upon the exertions and instructions of these tardy ones, for means and ability and occasion to perform promptly the duties of life. It is particularly desirable and essential that the young who are now forming habits for life, should cultivate Punctuality, as one of the noblest and most promotive traits of character, and one of the first among the graces which adorn a well-ordered life.

SUCCESS NOT ALWAYS HAPPINESS.—We often see an old, weather beaten man, who never had any success in his life, who always knew more, and accomplished less than his associates, who took the quartz and dirt of the enterprise, while they took the gold; and yet, in old age he was the happier man! He has a sum of hope, and they of desire and greed; and amidst all this misfortune, and these mysterious providences, he has had that within him which rose up and carried his head above all troubles, and upon their world-wide waters bore him up like the old ark upon the deluge. It was the deluge that gave out—not the ark.

SATISFIED should not be like a saw, but like a sword—it should cut, not mangle.

Sabbath Musings.

HERE AND HEREAFTER.

BY KATE CAMERON.

How can we sin, when night and day
The solemn stars above us shine,
Still gazing downward on our way
With their calm eyes divine?

How can we fear, when every bird,
And every little blossom fair,
Which, by a gentle breeze is stirred,
Speaks of God's care?

How can we mourn, though friends grow cold,
Or from our fireside widely roam;
Since we so often have been told
That this is not our home?

And e'en when those, most fond, most dear,
Are borne unto the silent tomb,
How can we shed for them a tear,
Or think of Death with gloom?

This world is but a resting-place,
Our home is far above the skies;
Then, while our daily paths we trace,
Still upward let us rise.

And when we reach the pearly gate,
And to the city enter in,
We shall throw off Care's heavy weight,
We shall be free from sin.

There we shall meet, no more to part
Those who, with us, on earth have trod,
And gather with the pure in heart,
Around the Throne of God.

Rochester, N. Y., 1868.

THE GRAVE.

THE grave is a common theme. Our minds often revert to it against our will. There is something connected with the "narrow house" which leads us into superstitious feelings from the contemplation of which we instinctively shrink. Death is a subject upon which we try to avoid reflection. We throw ourselves upon the gayeties of life by which to rid ourselves of these thoughts. While we are reveling in this little whirlpool of mirth, the last "great change" creeps silently upon us, and we who have whirled away an existence,

"Sleep where all must sleep."

There is something possessing the mind while bending over the grave of a dear friend which is melancholy, yet impressive. In memory, childhood is brought before us. We dwell upon the days we have spent in life's green spring with the object which now lies cold in death. Youth, with its joys and its sorrows, comes flitting before the imagination—its hopes and its fears are mirrored from the heart—its happy days are memory's treasures. But now how changed the picture! the sepulchre of a friend is before us,—with him "life's fitful fever" is over; we stand above his "lifeless clay," and shed the tear of friendship that it may mingle with his cold ashes. The friend with whom you have wandered "o'er life's bleak waste" lies low beneath the very spot where you are standing. Pause and reflect. *Hay* fleeting is life—its joys how transient. Pale manhood chases the fleeting phantom of youth to the shades of old age, when earth gathers them to her bosom, the car of time rolls on in its deep tumultuous tread, and they are lost in oblivion. The changes of time, how marked! Where are the orators of Rome, whose eloquence astonished the world? CICERO, DEMOSTHENES, CAESAR?—the night winds whistle through the lonely aisles where their bones repose. Where now are the Patriots who fought in the American Revolution? WASHINGTON, LAFAYETTE?—the battle cry has died away—the weapons of war have been laid aside—those that wielded them are powerless,—the multitude of the past sleep in the grave. With them the contentions of life have ceased—no earthly resentments work within the cold hearts which no longer beat with animated life—with death ceases every envious feeling.

There is nothing which so tends to humble the proud spirit as the thought that the splendor of earth must go down with us to the grave—there is nothing which so blunts the sense of false pride as the reflection that we are all destined to meet a common end. The magnificence of earthly grandeur may follow the mighty of earth to the grave, and there may be something in all this pomp and splendor to lighten the remorse of the proud spirit,—it may show a cold respect of the living for the dead—but it fails to remove one pang from the heart of the true mourner. When the turf shall have covered the last remains, pride and pomp are forgotten, the "last lingering remembrance" is reversed, and the lowly form is left to moulder in the dust.

Is there not something in these reflections which impresses one deeply with the thought that earthly honors are but frail? Should we not all bow in reverential awe before the majesty of the grave, where the poor of the earth "sleep as sweetly as the king and monarch?" Here is no distinction; high sounding titles fall from the possessor; earthly grandeur sinks into the gulf of oblivion; its devouring waves sweep over all; no foot-prints are left upon the sands of time—the dead are all booked for eternity.

From the contemplation of these sad thoughts we shrink, for they impress one deeply of the mutability of earthly acquirements. We know not when we are to leave the alluring scenes of life.

"Night wanes—the vapors round the mountain curled,
Melt into morn, and light awakes the world,
Man has another day to swell the past,
And lead him near to little, but his last."

Chardon, Ohio, 1868.

FORBES.

CONTENTION.—An old divine, cautioning the clergy against engaging in violent controversy, uses the following happy similes:—"If we will be contending let us contend like the olive and the vine, who shall produce the most and the best fruit; not like the aspen and the elm, which shall make the most noise in the wind."

FIRE will not tarry in a single coal, but if many be laid together it will be long before it is clean gone. A single tree may not afford much shelter for a traveler, but he will rest beneath the thick boughs of the grove; so will Jesus often sit longer where many of "the trees of the Lord" are planted.

The Traveler.

Written for Moore's Rural New-Yorker.

Sketches from the Alps to the Adriatic.

NUMBER SEVEN.

Disagreeable Walking—Italian Raftmen—Scene at a Hotel in Trent—Church of St. Maria Maggiore—Down the Valley of the Adige—The Plains of Lombardy—Scenery—Productions—Entering Verona—The Old Roman Amphitheatre.

THE *Stellwagen* carried me back to Bozen, where I remained till late in the day, and then started down the valley of the Adige, intending to walk in the cool of the evening. The weather, in fact, was getting too hot for walking in the middle of the day, when the June sun shone down into the narrow valleys with a fierceness I never before experienced. Clouds of fine stone-dust blow up from the McDamized roads, and fairly whiten the fields and trees along the sides. Added to this, a high wall shut out the view of green fields and vineyards on each side, and seemed to reflect the heat with double fervor, and compress the dust till one could scarcely breathe. I resolved shortly to adopt a different mode of traveling.

Late in the evening, I stopped at the little village of Branzoll, where the Adige first becomes navigable. Though yet in the German part of the Tyrol, I heard more Italian spoken than German, and could detect a change in the appearance of the people. It is interesting thus to pass from one country to another, especially where there is a difference in climate and language. I saw the brown countenance, with the blood flushing slightly through, and the black hair and eyes, which are characteristics of a Southern race. Men in shirt-sleeves, ragged boys, and coarse-looking women, were collected in groups before the inns, resting after their day's labor, and making themselves merry over brown bread and bad wine. There was a party of Italian raftmen who spoke a little German, and they offered me passage on their raft for a trifle, to Trent, or even to Verona if I wished. They intended to start early next morning, and said they would arrive in Trent at nine o'clock in the forenoon. The novelty of the ride induced me to accept their offer, and at three o'clock the captain of the raft came to my room and waked me, and I dreamed. But when I searched for my cane it was nowhere to be found, and I recollected that I had left it in the room below, where I had taken supper. The room was locked, the "hansknicht" nowhere to be found, and as my cane was too old and too good a friend to desert quickly, the captain became tired of waiting, and went off swearing, and I returned to bed. A couple of hours later I got my cane and breakfast, and then walked on six miles, and stopped at a village where I took the *Stellwagen* for Trent, thinking that it was better, after all, than to have trusted myself alone to those Italian raftmen, on the rapid river, in the early morning. All regret for the raft ride was annihilated on passing through a village some miles from Trent, at one o'clock in the afternoon, when I saw my raftmen sitting before a *caffè* smoking and drinking, with no intention of reaching the city that day. Nor did I like the dark countenance of the captain, though in the dusky light of the preceding evening he had impressed me favorably.

We entered Trent down a long, straight road, running between rows of trees, rattled over a narrow street, and, suddenly surging to the very windows on the right hand side, wheeled shortly round to the left, and drove through a vaulted passage. There was a heavy rumbling in the darkness, a clatter of horses' hoofs on the pavement, and then sudden silence and cessation of motion, together with the breaking in of a mild light, announced the termination of our day's journey in the courtyard of an inn, bearing the sentimental name of "Moonshine." The doors of the coach were opened, the steps let down, and the tired passengers descended to the pavement, and showed plainly by their actions how great a luxury it was to walk about and straighten themselves once more. A crowd of men and boys was assembled around. Some were porters, very anxious to serve the gentlemen, and two or three tenderly urged me to allow them to hold my light traveling sack, implying by their actions, that they feared so much exertion of strength on my part would greatly impair my convenience and enjoyment; or, at least, add nothing to their own. Some were taking the baggage from the top of the coach, some were unbiting the horses which they led away, through a long, dark passage to the stables in the rear of the inn—others were idlers and lookers on, scrutinizing the passengers, and gratifying that morbid curiosity which always exists where a stage coach regularly stops. German, Italian, and French were spoken, and I was amused to hear a sharp little boying out "there's a jolly beef steak," even before the portly, red-faced Englishman had opened his mouth.

My attention was now attracted to this half-German and half-Italian inn. The coach had stopped in the courtyard, nearly in the centre. Right above it was a patch of sky, seeming but little larger than the top of the wagon. The inn, surrounding this courtyard, was four stories high, and under the windows of each story ran balconies, five or six feet wide, and having light railings in front of them. Tables were spread there, by which guests were eating and drinking, and amusing themselves by watching the scene round the coach, in the yard below. Part of the roof sloped into the court, and water-spouts projected from the four corners. I found a flight of stairs in a dark corner, and going up to one of the balconies, sat down to dine. It soon began to rain, and the four spouts in the corners poured down streams of water. The coach was drawn under the balconies, amid half a dozen other vehicles, and the streams from the spouts splashed upon the pavement stones, and ran off in a torrent towards the stables.

It was nearly night, and the rain came down in great quantities, but lightly, as if falling a short distance, and, indeed, the clouds seemed to touch the church spires. But I did not forget to take an umbrella, and visit the church of St. Maria Maggiore, where the famous Council of Trent held its sittings in the middle of the 16th century. There is an obelisk of red marble, bearing a commemorative inscription, in the square before it, but about

the church itself, there is nothing remarkable, except an appearance of recent construction, which makes you think, at first, that you have come to the wrong place.

In the morning I entered the *Stellwagen* again, and continued my journey down the valley of the Adige. I passed through Rovereto, and by the height of Rivoli, where MASSERNA earned the title of Duke. The mountains grew lower and smoother, the jagged, snowy peaks disappeared, and forests of deep green took their place. Finally I passed between some ranges of low hills, and emerged from the narrow Alpine valley upon the plains of Lombardy.

As the horses trotted slowly over the level road, I had a good opportunity to observe the cultivation, the scenery, and the growing grain and fruit. The plains of Upper Italy, which extend from Milan to Venice, and from the Alps to the Apennines, produce more abundantly and support a greater number of inhabitants than any region of similar extent in the world. The population of France is sixty-four to the square mile, that of Belgium one hundred and forty-three, that of Holland and Great Britain, (if I mistake not) one hundred and sixteen, while that of the Lombard plains is one hundred and seventy-four. The fertility of this region is owing partly to its naturally rich soil, but mostly to the advantages of a complete irrigation, and its delightful climate. The abundant waters of the Alps flow downward through numerous rivers, and serve to flood the lands when required, and those great natural reservoirs, lakes Garda, Como and Maggiore, supply large regions in the severest droughts. The whole country is planted with fruit and mulberry trees, which are seldom allowed to grow to their full size, but are shortened and trimmed, so that their shade will not injure the grain below. Grape vines are planted at the roots of the trees, which are allowed to spread over the lower branches, and then are trained from one to another, hanging down in green festoons between them. There they stand, those trees of golden fruits and gorgeous silks, all over the land, bound together by the generous vine which ripens, in the dreamy days of autumn, its white and purple clusters. Underneath the trees grow the various grains, and roots, and grasses, in abundance, for the heat of the climate, and the continual moisture overcome the bad influence of the vines and trees.

The scenery is rather monotonous, which is owing to the equality of the surface, to the similarity and regularity of its productions—in a word, to the entire absence of bold and striking features in the landscape. There are no fences, but the land is cut up by numerous canals,—there are, of course, no forests, but there are also no large open fields, as in England and America. There are no trees of the unchecked growth of centuries, to heap up great piles of foliage, and cast large masses of shade. The patches of grain are commonly small, often but a few rods square, and the intermingling of the various colors, reminds one of a brilliant counterpane. Thus the whole plain has the effect of a garden, and the appearance of great labor and productiveness, compensates, in a degree, for the want of variety and striking general features.

At length the coach passed the gates of Verona and paused a moment to let an officer examine, in order to ascertain if anything dangerous were concealed about it. During this delay, my attention was attracted to the front walls of a house close by, that were spotted by the marks of hundreds of bullets which the French fired in 1895. The officer completed his examination and the coach drove on through the narrow streets of the greatest and completest Italian city I had yet seen—by tall houses, past shops, open to the sidewalks, in which tailors, and shoemakers, and blacksmiths, and carpenters, were working; under awnings that shaded the whole street for long distances, by heaps of oranges, lemons, and great baskets of cherries, apricots, strawberries, gooseberries; through a market, with cords of vegetables, under great umbrellas of white canvas; through another vaulted passage, finally stopping in an open courtyard in the centre of a hotel, bearing the sonorous Italian name of "*Albergo delle due Torri*."

I paused at Verona only to examine the old Roman Amphitheatre which is contemporary with the Coliseum, and though not so large, yet kept in a more perfect state. It gave me a strange sensation to stand beside this, the first structure I had seen of an age anterior to the Middle Centuries.—The pavement is three or four feet lower than that on which the city now stands. The blackened and shattered outside walls are yet a hundred feet high, and moss and grass cling in their crevices. There are the damp, dark passages, leading to the cells where the wild beasts were confined; there the long arena, and the tiers of marble seats, rising like steps, to the top of the outer wall, and I fancied the same eighteen hundred years ago, when twenty thousand spectators of noble Roman blood sat thereon, and the vast structure rang with shouts as they gazed on the gladiatorial combats below.

G. F. W.

HOW COFFEE CAME TO BE USED.

It is somewhat singular to trace the manner in which arose the use of the common beverage, coffee, without which few persons, in any half or wholly civilized country in the world, would seem hardly able to exist. At the time Columbus discovered America, it had never been known or used. It only grew in Arabia and upper Ethiopia. The discovery of its use as a beverage, is ascribed to the superior of a monastery, in Arabia, who, desirous of preventing the monks from sleeping at their nocturnal services, made them drink the infusion of coffee, upon the report of some shepherds, who observed that their flocks were more lively after browsing on the fruit of that plant. Its reputation spread through the adjacent countries, and in about 200 years it reached Paris. A single plant brought there in 1714, became the parent stock of all the French coffee plantations in the West Indies. The extent of the consumption can now hardly be realized. The United States alone annually consume it at the cost of its landing, of from fifteen to sixteen millions of dollars. You may know the Arabia or Mocha, the best coffee, by its small bean of a dark yellow color. The Java and East India, the next in quality, are larger and of a paler yellow. The West Indian Rio has a bluish or greenish, gray tint.—*Selected.*

INDIANA.

SEALS OF THE STATES.—NO. XXV AND XXVI.

INDIANA extends about 275 miles north and south, and 135 east and west. On the north is the lake and State of Michigan; on the east, Ohio; on the south, the Ohio river, and on the west, the Wabash. Across this latter river is Illinois.

Indiana, topographically speaking, bears great resemblance to Ohio. In the south is the same hilly surface; and above, the same undulating or level land—of a prairie character sometimes; and approaching the north, more barren and marshy. The river lands are almost always rich and fertile. As in surface, so in soil and climate, Indiana is very like Ohio.

In 1850 the population of the State was divided as follows:—Whites, 977,164; Colored, 11,262; Indians, 23; making a total of 988,439.

Indiana was settled by the French in the latter part of the seventeenth century, and ceded to Great Britain in 1763. At the close of the American Revolution it became a part of the Republic. It formed a portion of the North West Territory until 1800; it then, including the present State of Illinois, was erected into the Indiana Territory, and was finally admitted into the Union as an independent State, 1816. The present Constitution came in force in 1851.

The Government of Indiana is framed as follows:—The Governor of Indiana is chosen by the people for four years—a plurality of votes carrying the election. A Lieutenant Governor is chosen at the same time, the latter being President of the Senate, and discharges the duties of the Governor in case of his death, resignation, or removal. Senators and Representatives are apportioned among the counties every six years—the number of white male inhabitants over twenty-one years of age forming the ratio of representation. The Representatives, according to the Constitution, "shall not exceed 100," and are elected for two years—one half every two years; Senators limited to 50, chosen for four years—one half every two years. The Legislature meets annually, in December, at Indianapolis. The Judges of the Supreme and Circuit Courts are chosen by the Governor, with

ILLINOIS.

the consent of the Senate—term of office, six years. The Chief Justices of the Circuit Courts are selected by the Legislature, and the Associate Judges by the people. The right of suffrage is enjoyed by every male citizen over twenty-one years of age, who has resided in the State the six months preceding an election.

ILLINOIS is 380 miles in length, and 200 miles in breadth (at the extreme points). The general surface of the country, as in Indiana and Ohio, is that of elevated table-lands, with southward inclination, though it is more level than the neighboring States. In the lower portion there is a little hilly land—in the north west, some broken tracts—upon the Illinois river, lofty bluffs, and still higher and bolder points upon the Mississippi.

The earlier history of Illinois is written with that of Indiana. It was severed from the Indiana Territory in 1809, erected into a Territory of itself, and finally admitted into the Union as an independent State, Dec. 3d, 1818. The Constitution now in force, was adopted in 1847, and went into operation in 1848.

In 1850 there were 145,544 dwellings in the State, and 851,470 inhabitants.

The form of government is thus described:—The Governor is elected by the people for four years, but is eligible only four years in eight. A Lieutenant-Governor is elected at the same time, who is President of the Senate, and in case of the death, resignation, or absence of the Governor, discharges his duties. The Senators, 25 in number, are elected for four years, and the Representatives, 75 in number, for two years. The Judges of the Supreme Court are elected for a term of nine years, one of whom is chosen every three years; the Judges of Circuit Courts for six years, and of the County Courts for four years. The right of suffrage is universal, all white male inhabitants 21 years of age, who have resided within the State one year preceding an election, have a right to vote. Elections by ballot, and are held, on Tuesday next after the first Monday of November, biennially.

CURIOSITIES OF CRYSTALS.

The wind is from the northeast, an ashen gray sound sweeps close overhead, the general exclamation is, "it feels like snow." Soon the flakes begin to descend; at first leisurely and few; then swifter; and finally faster, faster. Before an hour, the earth is covered with a white mantle, composed of millions on millions of little crystals, each as perfect of its kind as a diamond, and each in itself, if you will only look, as beautiful. Take up one. It melts in your hand; it is gone. See that other, on the very top of a snow-drift, glistening, gem-like in the sunshine. A while ago, it was vapor, floating in the sky; before that, it was a drop of sea water; to-morrow it will be fluid again, and mingling with the ocean. Examine its shape. It is like a tiny star, cut in Carrara marble. Yet sculptor, nor even lapidist, could ever rival it. No marble is fine enough to fabricate it. What subtle power in nature has made this snow-flake so different in appearance from the rain-drop, yet substantially the same? The very boys in a telegraph office will tell you it was magnetism. Yes! it is this, as yet almost unknown agent, the motive power by which we send "lightning" messages to our friends, which helps to crystallize alike the diamond at the bottom of the mine, and the snow-flake high up in the heavens.

The whole subject of crystals is beautiful beyond imagination. It is crystallization and crystallization alone, which draws the line between the diamond that flashes on a lady's finger and the charcoal that smokes a kitchen maid. Sandstone and granite, limestone and marble have their essential differences in crystallization. One has been formed in the laboratory of nature, by the slow deposit of matter held in solution in primeval seas, the other by particle on particle, also held in solution, arranging itself in the precision of soldiers at a review. No architect ever built more regularly than nature, when constructing even the smallest crystal. Plants and animals grow by excessive developments; increase by assimilation through chemical changes; but crystals are equally perfect in their earliest stages, and enlarge only by accretion. Yet crystals, like all other created things die in time. Mines abound with skeletons of crystals. Crystals differ in shape—as the microscope reveals—almost as much as plants themselves. Yet the same substances always crystallize in the same forms, at least under the same conditions, so that we may say there are tribes and races of crystals, with typical shapes, exactly as of men.

Crystallization is found through all nature.—There is not a substance which, when allowed the free movement of its particles, does not exhibit a frequency to crystallize. Water, at a low temperature, crystallizes into ice. Metals, slowly cooled after melting, crystallize. The gases, evanescent as they may seem, may be made so artificially cold as to crystallize. Our children eat crystallized sugar, under the name of rock candy, and we ourselves use it in the loaf, crystallized in another form. What is glass but a crystal? The sizes of crystals vary infinitely. There are crystals too small to be recognized, except under a microscope; and there is one at Milan, weighing nearly nine hundred pounds. The White Mountains of New Hampshire are a vast

aggregation of crystals. The Mammoth Cave in Kentucky is an enormous museum of crystals. As yet, however, with all our knowledge, we are comparatively ignorant of the laws of crystallization. Under them we see atom arrange itself by atom, in myriads, myriad forms; we discover, also that not only magnetism, but light and heat exercise an influence in crystallization; but there our information substantially stops. The science of crystallization is almost a sealed book. Its mightiest curiosities still lie, like the virgin islands of the Pacific, before the day of Cook, awaiting the perseverance of some fortunate explorer.—*Selected.*

A HUNDRED YEARS AGO.

THE Pittsburg (Pa.) people are preparing to celebrate, with public parade, orations, processions, &c., on the 25th inst., the centennial anniversary of the capture of Fort Duquesne, which stood on the site now occupied by their city. Alluding to it, the *Pittsburg Post* draws the following sketch of the era in which that event occurred:

"One hundred years ago there was not a single white man in Ohio, Kentucky, Indiana and Illinois. Then, what is now the most flourishing part of America, was as little known as the country around the Mountains of the Moon. It was not until 1769, that the 'Hunter of Kentucky,' the gallant and adventurous Boone, left his home in North Carolina, to become the first settler of Kentucky. The first pioneer of Ohio did not settle until twenty years after this time. A hundred years ago, Canada belonged to France, and the whole population of the United States did not exceed a million and a half of people. A hundred years ago, the great Frederick, of Prussia, was performing those exploits which have made him immortal in military annals, and with his little monarchy was sustaining a single-handed contest with Russia, Austria and France—the three great powers of Europe combined. A hundred years ago, Napoleon was not born, and Washington was a young and modest Virginia colonel, and the great events in the history of two worlds, in which these great but dissimilar men took leading parts, were then scarcely foreshadowed. A hundred years ago, the United States were the most loyal part of the British Empire, and on the political horizon no speck indicated the struggle which, within a score of years thereafter, established the greatest republic of the world. A hundred years ago, there were but four newspapers in America,—steam engines had not been imagined, and railroads and telegraphs had not entered into the remotest conceptions of man. When we come to look back at it through the vista of history, we find that to the century which has passed has been allotted more important events in their bearing upon the happiness of the world than almost any other which has elapsed since the creation."

GREAT men stand like solitary towers in the city of God; and secret passages running deep beneath external nature, give their thoughts intercourse with higher intelligence, which strengthens and consoles them, and of which the laborers on the surface do not dream.—*Longfellow.*

A HEAD that listens to folly in youth, will hardly be honored in old age.

The Young Ruralist.

A FRUIT GARDEN.

MASSA EDS.—Having some thoughts of starting a small fruit garden next spring, I wish to make the following inquiries:—What four kinds of pears would do best on the quince?—varieties which, with good treatment, would grow thrifflily, bear well, and in succession, and be hardy. Does not the Bartlett pear, grown upon the pear stock, make a rather unhealthy tree while young?—and, finally, will you mention a complete and reliable fruit-book—one whose directions you will yourself endorse. By answering the above questions you will greatly oblige a
Walker, Mich., 1858.

REMARKS.—For an early pear, we would like to plant Bloodgood, Dearborn's Seedling, or Bourne Giffard. Then Virgalle, Loutas Bonne de Jersey, and Duchesse d'Angouleme. A good winter pear, as the Easter Beurre, would be desirable. The Bartlett is not unhealthy as a standard, but the fruit is not as large as is produced on quince roots. *Downing's Fruit and Fruit Trees of America*, contains, besides practical information, a description of almost every variety of fruit cultivated in this country. *Barry's Fruit Book* is a practical hand-book, giving instructions on every point of culture, from planting the seed to gathering the fruit. It is just such a book that the fruit-grower will find it necessary to consult about every day in the year. Another work containing a good deal of the very best of directions for culture—given in that pleasant and forcible manner, which is so peculiar to J. J. Thomas, and that makes a man or boy feel ashamed that he ever pursued a different course—is *The American Fruit Culturist*. Besides directions for practice, it contains descriptions of a great variety of fruits.

THE BELTED KINGFISHER.

THE Kingfisher inhabits all our fresh water rivers and bays, from the extreme north to Mexico. There are several species, but only one is found in this country. Amidst the roar of a cataract, over the foam of the torrent, or by the smooth gliding stream he has been seen by most of our young readers, perched upon an overhanging bough, turning his piercing eye down into the waters for a sight of his scaly prey, which, when observed, with a sudden, circular plunge, he sweeps from their native element and swallows in an instant.

The voice of the Kingfisher is loud, harsh, and his cry is sudden and sometimes startling, but not unpleasant when heard with the sounds of rushing waters. He may often be seen skimming over the surface of the water, and sometimes apparently suspended and motionless for a moment, ready to pounce upon his prey. For many an hour have we watched these curious and industrious birds. They build their nests in the high river banks, first digging holes with their bills, sometimes four or more feet, horizontally. In size they are about twelve inches long, of a bluish slate color, and around the neck is a collar of pure white; the head is large and crested; the feathers are long and generally erect; the breast is blue and brown, the under parts white.

HOW TO MAKE A BARK CANOE.—On this subject we are to have at last the desired information. A gentleman of St. Marys, Canada West, writes "as many of the friends of my youth are now chiefs and warriors of the Six Nations, with whom I learned to be an Indian, and having many times assisted in the manufacture of the articles in question, I feel able and willing to render you all the information you seek. No doubt your young readers are south of 44° north latitude; if so, they cannot find the required material for a birch canoe in that region, but the elm or hickory supplies its place, and of the two the manufacture is very different. It must be remembered that all bark canoes can only be made when the sap is in full flow; there is another material, wherewith "bark" canoes may be made at any season of the year, which is much lighter and more lasting than the Indian can find in any forest, and which may be obtained in any village at a moderate cost. Of this material I made a canoe this Spring, and as I paddle about on our pretty Thames, with my wife and babies, such remarks as these may be heard on our village shores 'see, Mr. C—— has a bark canoe; the Indian that is in him must have vent,' and when they see me pick it up and carry it off, they are more confirmed with regard to my Indian propensities. The wonder has grown old now, as they see it often and know its parts; it carries five and weighs forty-two pounds."

In a week or two we are to be furnished with all the details, illustrated with drawings, if it shall be found necessary to a clear understanding of the matter.

INFORMATION WANTED FROM YOUNG RURALISTS.—I would like to ask three questions. 1st. I have got a pair of yearling steers which I want to break this winter. Will some of your readers tell me how to do it? 2d. How can I make a small yoke in which to break them? 3d. What is the best manner of fastening calves and yearlings?—W. R. A., Wemerville, Madison Co., N. Y.

ROCHESTER, N. Y., NOVEMBER 13, 1858.

RURAL NEW-YORKER FOR 1859.

To the Subscribers, Agents, and all other Friends of the RURAL NEW-YORKER.—Greeting:

IN connection with Prospectus for the Tenth Volume of the RURAL NEW-YORKER—given on opposite page—we desire to address you relative to the great reduction of Club Terms, and to briefly state our reasons therefor. Please bear us for our and your cause, and judge whether we are right in adopting the plan and rates announced.

Many of you have not only borne us company, but nobly seconded our efforts, for nearly a decade; and hence, knowing the interest you have manifested and still, we trust, feel in the RURAL and its objects, we confidently believe you will heartily approve the course we have decided to pursue. And thus believing, we trust you will aid us with your advice and influence in new and renewed efforts to augment the circulation and usefulness of a journal which, we may be permitted to say, has become with your assistance, an "institution" of the land—one which wields a somewhat large, wide and, it is believed, most salutary influence upon Individuals, Families and Communities. You and I, kind reader, know that the RURAL has accomplished some good in its day to both the risen and rising generation—how much can never be estimated—and we also know that its power and influence for good can be immensely increased, without lessening its purity or value. To aid in accomplishing this laudable object speedily, we have resolved to greatly reduce the Club Terms of the RURAL, and appeal to Agents, Subscribers and other Friends to aid in extending its circulation and influence. In so doing we may not realize any profit the first year, and perhaps not sufficient in future to remunerate us fairly for the necessary labor, expense and responsibility—but, be that as it may, the decision is made, and we shall abide the result.

The club rates for the new volume will vastly lessen our receipts for the same number of copies we now furnish—but if, as we hope will be the result, (provided those herein addressed approve the plan, and lend their influence,) many thousand subscribers are added to its present circulation, our aggregate receipts will be such that we can afford as good, if not a better, paper than heretofore. If all who profess an interest in the success of the paper and consequent promotion of its objects, will manifest it by efforts in behalf of its circulation, we shall be enabled to improve the paper at the new rates without loss, while the great majority of subscribers will receive the benefit of the reduction and improvement.

Our first reason for the reduction was, and is, the low price of produce, and the consequent scarcity of money among the Rural Population. We resolved to give those to whom we mainly look for support a decided benefit—and it is such, though what counts only shillings in favor of individual subscribers, figures thousands of dollars against us. Of course this great reduction will preclude us from offering, or affording, such large premiums as we have heretofore given. But this, we are confident, will not be objected to, for the great majority of agents and active, working, influential friends of the RURAL labor for the cause and not for self-interest. Moreover, the greatest objection

urged against the RURAL of late years, has been that we paid such large premiums—many averring that we ought to discontinue the practice, and give the amount to subscribers. We now do this, AND FAR MORE—for the reduction in rates is far greater, in the aggregate, than the amount offered in premiums the past year.

Now, will Subscribers as well as Agents stand by us, and see that our list is increased in their respective localities? Shall the RURAL have ten subscribers next year where it has three or five this—twenty or thirty where it has ten or fifteen—thirty, fifty or a hundred where it has from twenty to thirty? It certainly can have such increases in many, aye, hundreds of places, if its friends will kindly volunteer their good offices in its behalf. It has never been, and is not now, our purpose to get rich out of the RURAL—but we desire, more than ever, to increase its circulation and usefulness all over the land. To us the power of benefiting our fellow men and the country, is preferable to wealth, leisure or luxury—and hence it is that we have adopted, as a means of attaining this object, the course now announced.

FRIENDS OF THE RURAL NEW-YORKER! Will you aid us in our earnest endeavor? You can if you will—and we ask that you will with great confidence, never having appealed to you in vain. All that is necessary is a little timely effort among your neighbors and acquaintances. Every reader of the RURAL can obtain from one to ten, thirty or fifty subscribers—and if its friends will only make "a long pull, a strong pull, and a pull all together," it will, on or before its Tenth Birthday—Day—the first of January ensuing—have full One Hundred Thousand Subscribers! What say, tried friends, and new ones—you to whom we are already indebted for manifold and most substantial favors, and you also to whom we have but recently been introduced—will you enter the arena in behalf of the model RURAL, LITERARY AND FAMILY WEEKLY of America? The RURAL has a good name through all the land, we are proud to know;—none say "trash," "humbug," or "mad dog" of a sheet which has ever and always "defended the right," and ignored, condemned and exposed the wrong—which has constantly and zealously sought to promote the best interests of its readers and community. It is a good paper to work for, as its influence is in the right direction. We pause for your decision, which we confidently believe will be in its behalf—only adding that Now is the TIME FOR ACTION!

—See first column of next page.

THE NICARAGUA EXPEDITION.—The following is the closing paragraph of President BUCHANAN's proclamation in reference to the movements now in progress against Nicaragua. In the opening portion of the document, the merits of the expedition are commented upon, together with an analysis of the character, means and prospects of the leaders in this disgraceful scheme, and the matter is summed up thus:

"For these and other good reasons, and for the purpose of saving American citizens who may have been honestly deluded into the belief that they are about to proceed to Nicaragua as peaceful explorers, if any such there be, from the disastrous consequences to which they will be exposed, I, JAMES BUCHANAN, President of the United States, have thought it best to issue this, my proclamation, enjoining on all officers of the government, civil and military, in their respective spheres, to be vigilant, active and faithful in suppressing this illegal enterprise, and in carrying out their instructions to that effect, and exhorting all good citizens to have respect for the law, and their regard for the peace and welfare of the country, to aid the efforts of the public authorities in the discharge of their duties."

UNITED STATES ARMY.—The present military force of the United States consists of nineteen regiments of the line, composed of the following corps:—Five regiments of cavalry, four regiments of artillery, ten regiments of infantry—making a grand aggregate of thirteen thousand rank and file of all arms. This little army covers an area of over two millions of square miles, being two-thirds the area of all Europe. There are eleven hundred commissioned officers, including one hundred medicine officers, eight hundred and fifty of whom graduated at the military academy, and two hundred and fifty civil appointments. The nativity of these officers is as follows:—Born in the United States, 1,060; Ireland, 14; France, 8; England, 6; Germany, 3; Cuba, 1; Turkey, 1; at sea, 3. The militia force of the United States is computed at 3,000,000 effective men of which the State of New York claims to furnish 500,000.

DREADFUL RAILROAD ACCIDENT.—The New York Express train for the West, which left Corning on the morning of the 28th ult., for Buffalo, on the Buffalo & Corning Railroad, was thrown off the track near Conesus. Mr. O. Hurd, of Newark, Wayne Co., S. M. Reed, of Greene, Chenango Co., and an infant were killed. About fifteen persons were injured, several dangerously so. The cause of the accident was the spreading of the track.

FROM HAVANA.—The steamship Empire City arrived at New York, from Havana, on the 1st inst. An expedition of 400 mariners on board the steamship Berenguela had been sent to Tampico to force Gaseca to make restitution of the money he had made the foreign merchants pay. Two British screw steamers had arrived with Cooley slaves, and another was reported to have landed 1,000 negroes from Africa.

PROPELLER BLOWN UP ON THE HUDSON RIVER.—The steam propeller W. H. Foot, in steaming up the North River, on the 6th inst., was blown to pieces by the bursting of her boiler. Five persons were on the boat, four of whom were killed, and the fifth badly wounded. One man was blown one hundred feet in the air, his body falling on another steamer and crushing through the hurricane deck.

YELLOW FEVER IN NEW ORLEANS.—The deaths from this disease so far this year have been 4,457. The largest weekly reports were for the weeks ending September 5th, 13th and 19th, when the total deaths were 646, 663 and 642, of which 449, 472 and 444 were from yellow fever.

The Recent Elections.

NEW YORK.—The Republicans have been successful in this State (taking the reported majorities on Governor as the average) by 14,000 to 16,000 majority. The successful candidates are the following:—Governor—EDWIN D. MOSEMAN. Lieut. Governor—Robert Campbell. Canal Commissioner—Hiram Gardner. Inspector of State Prisons—Josiah T. Everest. The vote upon Congressmen shows an Anti-Lecompton majority of between 50,000 and 60,000. The Republicans elect twenty-nine and the Democrats four. The Assembly stands one hundred Opposition to twenty-eight Democratic.

NEW JERSEY.—The result in New Jersey is strongly in favor of Republicanism, every member of Congress chosen belonging to that party. The State Senate stands 11 Opposition, of whom 3 are Anti-Lecompton Democrats, to 10 Administration members. The Assembly stands 38 Opposition to 23 Administration. Majority on joint-ballot 17.—The aggregate Republican majority is 8,148.

OHIO.—The official Republican majority in this State is 20,926.

MICHIGAN.—The Republicans have elected their State ticket by from 6,000 to 10,000 majority. The latest returns indicate that the Legislature will stand—Senate, 22 Republican and 10 Democrats. House, 46 Republican and 33 Democrats.

ILLINOIS.—State ticket Republican. The Douglas Democrats have a majority of 5 in the House and 3 in the Assembly. Later returns seem to indicate the State ticket as Democratic.

WISCONSIN.—The election, as far as heard from, results in a Republican choice of 3 Congressmen.

MASSACHUSETTS.—Returns of the Governor's vote have been received from all the towns in the State but Brighton, giving Banks, Republican, a majority over all of 17,239. The Senate will stand thirty-seven Americans and Republicans to three Democrats. The House stands one hundred and ninety-seven Republicans, twenty-nine Democrats, ten straight Americans, with four to hear from.

MINNESOTA LEGISLATURE DEMOCRATIC.—The St. Paul Pioneer of the 23d ult., states that definite returns from every part of the State, except in one district, indicate that the Legislature will stand:—House—Democrats 39, Republicans 40. Senate—Democrats 31, Republicans 15. As the Democrats have a large majority on joint ballot the election of a Democrat to the U. S. Senate, vice General Shields, whose term has expired, is placed beyond question.

THE MINNIE RIFLE AND THE INDIANS.—From official reports it would seem that this effective weapon has been introduced into that portion of our service now employed against the Indians in Oregon. A letter from Col. WRIGHT to the Secretary of War says:—"I have for some time past sought to impress upon the men, by instruction and precept, the conviction that with our long range of arms we could kill the Indians in a fair fight, and not be killed ourselves. Our lessons have been well learned. The men fired at the gallant red rascals as they would have fired at targets, and the movements during the action were as orderly as on a field day. The enemy has lost courage, but he may change his tactics." A letter to the New York Herald, says of Col. WRIGHT's battle near the Spohn river:—"The Indians numbered five hundred, and fought well. The troops under Col. WRIGHT were four hundred and fifty, of which two hundred and ninety participated in the action. A guard of reserve of three officers and one hundred and fifty rank and file were left in camp, while the others went out to fight. The Indians were completely routed, with the loss of seventeen killed and thirty-five wounded. There were no casualties on the side of the soldiers. The battle and its results have demonstrated the immense value of the Minnie rifle, and explain the cause of Col. STEPHEN'S reverse when his men were armed with miserable muskets."

ARRIVAL OF THE QUAKER CITY.—The Quaker City, from Minnetonka on the 2d inst., arrived at New Orleans on the 5th, bringing the intelligence of the opening of the Tehantepec route.

The following dispatches are received:—The Indians with 400 troops from Oaxaca, entered Tehantepec on the 20th, having dispersed the forces of Zolago, who had now no hold on the isthmus. The country is unusually healthy, and the people in fine spirits, on account of the opening of the route, the success of which was absorbing all attention. A road will be opened to coaches between Almoja and Ventosa in a short time, when the transit will be made entirely by vehicles.

ROBBERY OF THE DELAWARE BANK.—On Sunday night week, the Delaware Bank, at Delhi, New York, was entered and \$37,000 stolen. The robbery was not discovered till morning, giving the perpetrator opportunity to escape. The money taken by him consisted of the following parcels:—\$13,000 in pocket bills, \$15,000 in mutilated Delaware Bank notes, \$8,000 in gold, and \$1,000 in other funds.—The police have been notified, and a reward of three thousand dollars is offered for the apprehension of the robber.

THANKSGIVING.—Thanksgiving Day will be observed in the following States, by appointment of their several Executives, as follows:

Maine	Nov. 25	Mississippi	Nov. 25
New Hampshire	" 25	Michigan	" 25
Massachusetts	" 25	Minnesota	" 25
Rhode Island	" 25	Wisconsin	" 25
Connecticut	" 25	Vermont	" 25
Maryland	" 25	Indiana	" 25
Illinois	" 25	New York	" 18
Iowa	" 25	New Jersey	" 18
Alabama	" 25	Pennsylvania	" 18

ANOTHER SECT DEAD.—The Parkerites (a sort of Baptists) built a church, twenty years ago, in Coles county, Ill., and so decreed it that if there was ever allowed within its walls a temperance lecture, a Bible Society meeting, a missionary meeting, or a Sunday school, the title was forfeited and fell back to the original owner. Ten years since, its pulpit became vacant for want of hearers, and now the sheep and swine sleep there.

DURING one week recently, there were shipped from St. Albans, Vt., 202,000 pounds of cheese, worth \$15,156, and 165,197 pounds of butter, worth \$29,771, bringing into the farmers of that locality the pleasant sum of \$44,927.

News Paragraphs.

THE New Orleans Delta of the 23d ult., says:—A malignant cholera broke out among the slaves of a Jefferson parish planter, and in one day, eighty out of about 100 on the place, died of the pestilence.

A LETTER from Geauga Co., Ohio, states that an epidemic dysentery has raged among young children in that section, ravaging every home and proving generally fatal. In the town of Chester, it is stated, but few infants have been spared by the pestilence.

WM. H. BARRY the oldest of the home-training brotherhood says that his system is equally efficacious in subduing women and children as horses. Being a widower with ten olive branches he has had ample opportunity to test the truth of his theory.

ISAAC HOLLAND, late door-keeper of the U. S. Senate, who died at Washington on the 1st inst., was the father of Stuart Holland, the gallant youth who perished on the ill-fated steamer Arctic.

GEORGIA has over 1,200 miles of railroad built and paid for, and yielding to the stockholders more than an average of 7 per cent. yearly dividend.—Within the next year 200 miles of additional road, completed and equipped, will be in operation.

THE Hawaiian Advertiser says that on the 10th of August a schooner plying between the islands with eight natives and three foreigners on board, upset. The natives picked up the foreigners, put them on the bottom of the vessel, and then started to swim to the nearest land—fifteen miles distant.—They swam during the remainder of that night, through the following day and night, and on Thursday six out of the eight landed on Nihaa, an old man and a stripling having proved unequal to the task.

A REMARKABLE sale of old United States cents took place in Philadelphia on Tuesday evening.—The collection was made by Mr. Edward Cagan. Seventy seven cents, of all dates, from that of 1791 down to 1839, were sold for the aggregate sum of \$128. The prices ranged from \$1.25 to \$28.60.—The latter price was given for a rare die of the Washington cent of 1792.

On the 4th of October, the city of Munich, Bavaria, celebrated the 700th anniversary of its foundation. The chief feature of the fête was an immense cortege in which 3,000 men and 500 horses figured, and which represented the respective centuries from the 12th to the 19th, with emblems, costumes, and the great personages of the national history at each epoch.

At New Britain, Conn., Frederick Westover, son of Amos Westover, was playing with an old gun-barrel, and after touching it off the third time with a slow match, ran about twenty feet, when the barrel burst, and a small thin piece, about the weight of a cent, struck him on the side, over the heart, going through his clothes and just breaking the skin. The heart ceased its pulsations and the boy died in less than ten minutes.

THE increase in the receipts of grain of all kinds at Chicago, during the present season, over the receipts of last season, amounts to about six million bushels. The exports have exceeded those of the previous year almost four millions.

THE Government horses and mules sold at Fort Leavenworth a few days ago brought prices ranging from \$5 to \$80 each. All these animals cost the Government as much as \$80, and many of them twice that sum. A great many of them sold for \$15 and \$20 each, only a few brought as much as \$80.

An English officer, direct from Paraguay, reports that Lopez is preparing effective modes of resistance and defense by building fortifications and obstructing the navigation of the river. He has placed chains and booms across, and proposes sinking light vessels in the channel, in which event our expedition could not ascend. Several Belgian and Hungarian officers are engaged in directing operations.

A SWEDISH woman passed through Detroit, last week, en route for Sheboygan, Wis., having been on the way 14 months, and ship-wrecked twice.—Her husband lives at Sheboygan.

A MURDER case, which has occupied the Courts of Alabama at intervals for fourteen years, was decided week before last. In February, 1844, an overseer employed by Dr. Chapman, of Henry Co., in that State, whipped a slave to death, and was found guilty of murder, but through some legal technicality escaped execution. He has now been convicted of manslaughter in the first degree.

CALIFORNIA travel is again seeking the Cape Horn route. Since the departure of the steamer Hermann, with a full load, the bark Vickery has sailed from New York with over 180 on board, and the clipper ship Gray Feather is nearly ready to follow.

THE OTHER SIDE.—As an offset to the highly complimentary "Rural" Letters from the People which we have given of late, we publish the following brilliant epistle, *verbatim*, *et literatim*, *et punctuatim*. The writer's notions of the "rural" are akin to those of our sedative monthly neighbor, and if the two worthies could have their way, we reckon the RURAL would soon be "done shut." We have the original copy of this letter, as received by mail:

Mr editor
I have sumthin to say about your paper. no doubt but it is A good won but papers ant no use, and if any body spends much time in readin them they cant urn there livin and so I dont read em and so save time and expense. you sea it wod cum to too dolers A year, and that wod by enoff to becker to last me six munts at least. I think folks dont ort to spend there munny on papers, my farther never did and every body sed that he was the smartest man in the country and had got the intelligentist famly of boys that ever dng tators
I think folks ort to no enuff to ho corn and pick sturn without readin the rural and other agricultural papers and if every body was of my mind there wod be no such A thing as A paper in the united states
A farmer

POPULATION OF CALIFORNIA.—The total number of votes cast at the California State Election of this year, is probably less than 85,000, while last year it was about 100,000, and in 1856 about 110,000. The population of the State had been steadily but slowly gaining from 1856 up to May last, when the Fraser exodus began; since then there has been a loss of about 15,000 voters.

The News Condenser.

Game is said to be very plenty in Massachusetts this year.

—John M. Botta is named as a candidate for President.

—There was a smart snow storm at Ballston on Wednesday.

—There were ten deaths from violence in N. Y. city last week.

—A tailor in Sharpestown, Md., is 38 years old and 30 inches high.

—In the Diocese of Louisiana there are 36 congregations of slaves.

—The Bank of Tennessee resumed specie payment on the 2d inst.

—The entire capital invested in the tanneries in the U. S., is \$18,900,557.

—Seventy five patents were issued during last week at the Patent Office.

—The soil of Turkey is found to be very favorable to the growth of cotton.

—Barn-burning is getting to be alarmingly frequent in Lancaster county, Pa.

—The English Government have ordered 3,000 coolies to be sent to Jamaica.

—The Queen Dowager of Spain has two millions of dollars invested in this country.

—The Missouri Democrat notices a new discovery of iron mines in that State.

—Louis Napoleon has from three to five millions invested in the United States.

—Frost was plainly visible throughout the State of Mississippi last Friday morning.

—It is said that the cost of a Sepoy war is beginning to excite alarm in England.

—Green peas are selling in Norfolk, Va., at 50 cents a peck, and are quite plentiful.

—The grand jury of New York are walking into the racetracks of that tax paying city.

—Over fourteen thousand bales of cotton were received in New Orleans on the 4th inst.

—On Thursday of last week, Lake Michigan fell, in a few moments, two feet and a half.

—The gold production from Australia this year up to the middle of August, is \$28,100,000.

—Lord Charles Wellesley, brother and heir presumptive to the Duke of Wellington, is dead.

—Col. Sumner has succeeded to the command of the Department of the West, of the Army.

—The royal families of England, France and Portugal are all expecting an increase this year.

—The number of deaths from yellow fever in New Orleans, up to the 24th of October, was 4,457.

—The new Post-Office building in Philadelphia will be constructed entirely of Pennsylvania iron.

—An extensive fire was devastating the Catskill Mountains back of Catskill last Thursday evening.

—Saline springs have been found near Moore's Hill, Indiana, from which very good salt is made.

—The total distance between St. Louis and San Francisco by the new overland route is 2,765 miles.

—Judge Bigelow decreed thirteen divorces in the Supreme Court at Boston, Mass., on Friday week.

—Eleven thousand males and six hundred females were imprisoned for debt in England in 1856.

—Rev. Dr. Burrows, of Richmond, while preparing to baptize several candidates had his watch stolen.

—Mr. Dallas, Minister to England, has written a letter to the President that he will return in the spring.

—The petty German Princesses, it is stated, are interested in American securities to about \$50,000,000.

—The health of New Orleans is improving. The number of deaths is reduced to twenty-five per day.

—It is reported that Mr. Preston declines the mission to Spain, after having intimated his acceptance.

—Ex-Secretary Stanton has become a permanent resident of Kansas, and is spoken of for U. S. Senator.

—Yellow fever has yielded a harvest for doctors in New Orleans—fee in each case \$100, "kill or cure!"

—Mr. Isaac Titcomb, of Newburyport, Mass., has an apple tree that has been in bloom four times this year.

—The value of the buildings erected in Chicago, during the past year, is estimated at over \$4,000,000.

—Mary Murphy, a native of Ireland, died in Fall River, Mass., a few days since, aged 103 years and 10 months.

—Secretary Cobb entertains the idea of increasing the revenue by recommending duties on tea and coffee.

—The tides at Norfolk, Va., are unusually high; in some places the wharves and streets have been overflowed.

—The corporation of Montreal have presented a complimentary address to Sir William Williams, the hero of Kara.

—Senator Douglas has given an unconditional transfer and full title of his donation to the Chicago University.

—The remains of a Rev. Mr. Brooks, who perished in the snow, have been found on Salmon Mountain, California.

—One Protestant and two Catholic clergymen have fallen at their posts in New Orleans since the epidemic commenced.

—Another demonstration against the introduction of the Confessional in the Church of England has taken place at London.

—The body of a large animal (species not stated) has been found in the Lake Superior copper mines, sixty feet below the surface.

—Private theatres are so much in vogue in Paris that an enterprising man has constructed "portable theatres" for saloons.

—A servant girl in New Haven ran off on Saturday week, with nineteen dresses belonging to the family with whom she lived.

—A dispatch from Washington says Gen. Ward, of Georgia, is appointed Minister to Sardinia, and not China as previously reported.

—The poorest church living in London is that of Woburn Church. It has decreased so as to amount to only between 25 and 26.

—The overland mail party which arrived at St. Louis a few days since, was detained 14 hours by a sand storm in the California desert.

—A French electrician in San Francisco announces that he has discovered how to take the gold from a quartz rock by electricity.

—Barry, the horse-lamer, instead of returning home, has gone from England to Sweden, and purposes seeing Lapland before he returns.

—During the month of September the gold coinage at the San Francisco mint amounted to \$

Choice Poetry.

THE WIND.

BY AMANDA T. JONES.

The wind came over the hills one day,
Singing a charming tune,
As light and low as the sleepy lay
Of a humming-bird in June.
I should not have heeded his idle song,
But his breath was on my nose,
And his arms around my neck were strong
In a fairy-like embrace.

"Like a child asleep," the sephyr said,
"I have lain the whole long night,
With the moonbeams spread above my bed
For a covering pure and white.
But just as the sun from out of the sea
Had lifted his princely head,
The morn, like a mother, lifted me
From out of my snowy bed.
Then up like a singing bird I flew
O'er meadow and grassy hills;
I sprinkled the clover heads with dew,
And bathed in a thousand rills.
I gathered the lithe green willow limbs
That bent so lovingly down,
And hung them over the laughing streams
In a beautiful glossy crown.
I swept the boughs of the beech aside
To look at the nestling birds;
The broken flower, at the fountain's side,
Smiled sweet at my loving words.
I scattered around with the busy hours
O'er forest and creeping vine—
I gleefully kissed the bending flowers
Till their lips were as red as mine.
And thus while I fly, each bud I pass
Will gather a host of charms,
Till the old nurse, Night, comes down at last,
And cradles me in her arms."

Then, "Whither away, O Wind, said I,
"And where hast thou been to-day?
And why is thy face so sad to see
When everything else is gay?"

"Alas, sweet wind," I sighed to say,
While the tears in my eyelids grew,
"I have not borne to a soul to-day
One drop of affection's dew.
I have not searched for the broken flowers
That wither along my way,
Nor noted the flight of the priceless hours,
Nor bent my knee to pray.
Nor ever a grateful thought have given
For the peace my life hath known,
And of all dear hearts beneath the heaven,
I have thought of self alone."

But, O! however my soul hath sinned,
Thy lesson of love I'll keep,
Then pass thou on, sweet, wandering wind,
And leave me alone to weep."

Black Rock, N. Y., 1883.

The Sketch-Book.

Written for Moore's Rural New-Yorker.

ESCALAPIUS, SENIOR AND JUNIOR.

BY CAROLINE A. HOWARD.

[Concluded from page 364, last No.]

Thus day by day did MARY WAIT, unknown to him, look deeper and deeper into his heart, and it is not strange that a shadow gathered about her own. Not that she was jealous or envious of the love that, her woman's instinct told her, was being freely lavished upon another. No, MARY was perfectly unselfish. Could she have looked into the future, and seen there the fruition of her friend's hopes, the perfection of his fancied happiness, she could have been almost content. Not quite, to be sure, but almost. As it was, she saw nothing before him but disappointment, and that the deepest which man can know at his time of life. She could only await the issue in silence and anxiety.

And OSCAR? We have said little of him. There has seemed to be nothing of importance to say. Absorbed for the most of his time in his studies, the ladies saw little of him except at table, or in the evening, when he usually sang with FANNY, played cards with them, or walked out with her. She seemed his constant and appropriate companion. Polite and attentive as he was to every one, there still seemed a brighter gleam in his eye, a pleasant tone to his voice, when FANNY was near. His manner seldom indicated more than a brother's feelings towards her. In fact they were almost as if he were a careless observer, an affectionate brother and sister, and as such the Doctor regarded them.

MARY WAIT paid little regard to OSCAR's symptoms—to her there was a more weighty interest in observing FANNY. And it was with many a sigh that she noted how each day FANNY had learned to listen for OSCAR's step, how her eye would brighten, and as quickly drop before his earnest gaze—how she would sit and listen by the hour to his voice, as he talked with others, and if observed, would turn suddenly and indifferently away.

Her step had grown a touch less elastic, her ringing voice was a tone sweeter, and at times seemed tempered with sorrowful tears. The carmine of her cheek had softened into peach color, and her manner, when not excited and fitful, was more subdued than was natural.

Her guardian thought she studied too much, or that she sat too long over those slippers which she was embroidering for him. So two hours were set aside from work and study, to be devoted to recreation. In vain FANNY remonstrated, and Miss WAIT was appealed to—he was sure she was pinning. She must have more company, must go more; and, to please him, she did—but it was a sad bore.

One afternoon OSCAR and FANNY had ridden away on horse-back, the Doctor was in his study, and MARY sat at the window of her room and watched them until they were out of sight. The day was warm and she was tired, so as the sun had almost set, she did not rise to get any work, but sat musingly watching the sprays as they fluted in the light breeze, and comparing the soft shadows which gradually deepened amid the branches, to the pensive thoughts which shadowed her mind.

She was roused from her reverie by the clattering of a horse's hoofs, and looking up expecting to meet FANNY's glowing face triumphant from a race with OSCAR, FANNY's horse bounded into the door-yard—riderless. With the wings of fear she flew down stairs, but light as were her steps the Doctor heard them, and was at her side ere she reached the gate. At first he knew not what had happened, but as MARY's white face was turned towards him, he saw the riderless horse quietly grazing at a little distance.

"O, FANNY! My FANNY!" was his startled exclamation, and springing upon the reluctant animal, he rode rapidly down the road.

MARY stood gazing after him until distance and dimness shut out his retreating form. Her thoughts seemed divided, for though pale and anxious, she murmured to herself—"My FANNY!"

The Doctor had ridden but a short distance before he came upon the missing party, at the roadside beneath a large elm. OSCAR, his hat thrown aside, and his damp brown locks pushed back from his pale face, was kneeling upon the ground, supporting the half-fainting FANNY in his arms.

A pang shot through the Doctor's heart. Not a pang of anguish at the thought of her apparent suffering. Ah! selfish human nature! Perhaps he had hoped to be the first to lift her insensate form, to pillow her aching head. The thought, if such a thought he had, was unworthy of him, and was but momentary. FANNY was not hurt, only stunned by the fall, and was soon able to return home. She insisted upon being permitted to ride her own horse for, "Poor Rollo," she said, "he only entered a little too ardently into the spirit of the race, and forgot that his mistress was on his back." So her guardian lifted her to the saddle, and walked by her side, holding the bridle rein.

Seeing her return thus, was a great relief to poor Miss WAIT, whose heart had been well-nigh breaking with suspense.

Although uninjured, FANNY did not seem to recover her usual health and spirits for some days. Her sleep was short and restless—she was silent, and cared little for society of any kind. OSCAR was devoted. He did everything in his power which might contribute to her amusement, and certainly succeeded admirably. He had almost completed his studies, and I suppose was quite a physician.

A few days after this occurrence, OSCAR went home for a short time, and it was astonishing to see what a difference there was in FANNY. Her guardian was seriously alarmed, and talked of starting for Saratoga Springs immediately.

They were seated on the piazza, Dr. WARNER, Miss WAIT and FANNY, when a visitor called and Miss WAIT left them. The Doctor thought a walk would do FANNY good, so drawing her hand into his arm, he led her down the garden path to where a rustic bridge spanned a little, purring stream, which seemed ever to whisper—"Don't tell! I will!"

But I will not tell, for I cannot, what they said. I only know what followed. They stayed a long time, longer than was prudent for an invalid. So MARY thought, as she sat at the window and watched for their return. But he was a doctor, she thought, and ought to know best, so she tried to be at ease. I suppose he forgot that he was a doctor.

At length she saw them approaching. His arm supported her, her head rested on his arm, and her whole frame shook with sobs. Something in his face, something in her manner, warned MARY not to meet them, and she flew to her room with a wildly beating heart. She had been there but a moment when FANNY entered, and flinging herself at her feet, cried:

"Dear MARY, what shall I do?"

MARY was silent. She felt the truth, and she waited, sure that she should hear it.

"O, MARY, advise me! You know I have no mother, no one to tell me my duty but you. He wants me to love him! O, I am so wretched! He is so good, so noble, that I want to please him. I ought to please him, but I cannot be his wife. I never thought of him so. I never can!"

"Did you tell him so, FANNY?"

"Yes, as well as I could. I scarce know what I said; but he understood me. Then I felt worse than ever, for he reproached himself so bitterly. He says that he has been a blind old fool, a traitor, thus to seek to win a young girl—a child placed in his care. But you know he is neither. He cannot help it if he does not love me just as a father would, and I wish to heaven I could love him as he would have me. But I could not, even if—if I were not—if I did not love—"

"OSCAR?"

"Do you know? I half thought that you read me. I did not tell him—I could not. His heart seemed heavy enough without knowing that the day when 'Rollo' threw me, I learned for the first time that OSCAR loved me, and I told him that some day I hoped to be his bride."

MARY WAIT soothed and caressed the excited girl as well as she was able, though her own tears fell fast, and her heart ached both for her and for that noble heart which she knew must suffer and bear alone. She did not sleep much—I think no one did in that house that night. The next morning she arose early, and descending to the dining-room, found on her plate a billet which enclosed another to FANNY. Her own ran thus:

"Dear Miss WAIT:—Business of an unexpected nature, has called me to New York for a few days. I was obliged to leave without seeing you, in order to take the early train. I feel sure that you will manage everything with your usual good judgment and consideration. OSCAR will return this afternoon, so you will not be alone. I will write to you should I stay more than two or three days."

That note was henceforth to be one of MARY's precious possessions. FANNY had no secrets from her, therefore she showed her the note which was left for her.

"FANNY:—After what has passed, I could not meet you this morning. Forgive my want of manliness. Would to heaven I could recall those words of mine. If I can make arrangements for your welfare, I think I shall leave for Europe in a few days. Whether we meet again or not, think of me leniently as your misguided

GUARDIAN."

And what did FANNY do? Why, she threw the letter from her, and went into a passion of tears. Then, partially arresting the flood, she stamped her foot, and cried,

"He shall not go! I won't let him. I won't

have any body else for a guardian! I'll write this minute, and tell him so!"

She actually looked handsomer and more like herself, than she had done for three months.

Miss WAIT suggested that she had better wait until OSCAR came. Perhaps his uncle had informed him of his intentions.

"No, I won't tell OSCAR anything about it! I am afraid he would be harsh. He would not see the matter as I do."

True to her word, she forthwith dispatched to Dr. WARNER "the sweetest little note." Had the Doctor not been, as he was, one of the most sensible men, it might have turned his head.

"Dear, Dear Guardian:—You have frightened me half to death with your sudden departure and your threat of going further still. I have scarcely drawn a long breath since. Do, please, come home soon, or I shall be sick. As to having any other guardian, I will not; and if you run away I believe I shall follow. As to what you allude to, I regard it as a dream. I intend to forget it immediately, and I beseech you, if you value my peace of mind, to do the same. I cannot afford to lose you, so do return to your

FANNY."

He returned, of course he did; but not as FANNY hoped, cheerful and calm. He was taken sick on reaching New York, and OSCAR went to accompany him home. He was sick some time, and never did any one have kinder nursing, more careful tending, than MARY and FANNY bestowed on him. MARY, especially, seemed his good angel. Her heart was in all she did. With FANNY, a feeling akin to remorse added ardor to her efforts.

But he lived and recovered. People tell of broken hearts. If there are such, I think they belong to those who are unsatisfied by a purer, diviner love than mortals can give. Dr. WARNER was not such an one. When once more he stood among them, he was paler, graver than ever before, and in his black glossy hair a thread or two more of gray had intruded itself. But his mein was dignified, self-possessed and kind. Inasmuch as he thought he had erred, he humbly accepted his disappointment as a punishment. Towards his ward, his manner was as ever kind and familiar, though somewhat more quiet and fatherly. As to her, she felt as though she had helped him to delude himself by her playful coquettishness. A consciousness of this threw over her conduct more dignity and grace, while it did not seem to diminish her affection. Her recent experience had divested her of much of her childishness in teaching her the responsibility of womanhood. A beautiful woman she was fast becoming; but we must not linger over her development.

Two years passed away. FANNY was twenty-one, and in full possession of her rights. But she did not seem so strenuous in maintaining them as in old times. At any rate she relinquished the right to her hand, heart and fortune to OSCAR WARNER, with as much grace as if it had been a favor to herself. OSCAR had graduated with credit, and already had some practice. Soon after the wedding they left for Europe, as OSCAR intended studying on the continent.

How poor MARY wept when FANNY was married. And FANNY kept her company in it with equal energy. FANNY was losing her dear and sisterly friend. MARY suffered an equal loss in that respect, with an additional one which FANNY could not be expected to appreciate. She was losing her place.

Miss WAIT was going back to her lonesome old farm-house, or perhaps to seek another situation. Greendale was to be shut up, and OSCAR and FANNY did their best to induce the Doctor to take his long intended trip to Europe then, with them. A sudden fit of obstinacy seemed to have seized him, for he would not go. Perhaps he did not desire their company.

They went. Greendale was abandoned to silence and cobwebs; Miss WAIT choked down the last sigh, plucked up the best and most cheerful heart she could, and went home to the quiet old life of Westfield. Dr. WARNER took lodgings in town,—in the heat of summer too.

I presume he felt lonesome, or more likely he thought Miss WAIT did—she had been so long accustomed to the pleasant society at Greendale—so he went to see her occasionally. I think it was very kind of him, especially as he could do so as well as not.

When the peaches were ripe he went and stayed over Sunday, and went to church with MARY. That visit convinced him that there never was such sweet bread and butter—such delicious peaches never grew before, as he ate there. And people wondered who that fine looking man was who went to church with Miss WAIT. Miss FANNY, the dress-maker, said she took his arm walking home, and little Miss MELLON told her beau that she thought MARY WAIT had grown pretty since she went away.

Ab, well—people will gossip. Dr. WARNER grew kinder and more considerate, apparently, each time he came. Some token of his regard marked every visit, and the visits themselves grew more frequent, until they were made regularly once a week, generally from Saturday night until Monday morning. Poor man, I don't wonder. It was kind of pleasant out at Westfield, and it helped to draw his mind from his disappointment. Here, too, he could talk of FANNY; together they repurchased her letters, for who knew her so well as MARY?

Young Dr. WARNER and lady were to return in the spring, but not to live at Greendale, for their future home was to be New York. Greendale was running wild without tenant. Dr. WARNER hated to sell or rent it, and could not bear the thought of living there alone. He talked it over with MARY, and finally it was agreed that she should return there as—

"Housekeeper?"

No, indeed! As Mrs. Dr. WARNER, to be sure! "A marriage of convenience?"

Ha! Do you think so? Ask MARY what he said to her when he sat on the rustic seat under the lilac bushes at Westfield. Perhaps she will tell you how he confessed his foolish and misplaced attachment, long since overcome—how he had learned to appreciate her in his sickness—how he was happier than he ever could deserve to be, and how pleased OSCAR and FANNY would be to find her the mistress of Greendale on their return.

How she told him how long and truly he had been loved, and how she had striven to be strong and faithful to her duty and her self-respect, and how she felt fully repaid. Ask her! Perhaps she will tell you all this, and—perhaps she won't.

MOORE'S RURAL NEW-YORKER,
AN ORIGINAL WEEKLY
Agricultural, Literary and Family Newspaper.

CONDUCTED BY B. D. T. MOORE,
WITH AN ABLE CORPS OF ASSISTANT EDITORS.

THE RURAL NEW-YORKER is designed to be unsurpassed in Value, Purity, Usefulness and Variety of Contents, and to be beautiful in Appearance. Its Conductor devotes his personal attention to the supervision of its various departments, and earnestly labors to render the RURAL an entirely reliable guide on the important Practical, Scientific and other Subjects intimately connected with the business of those whose interests it seasonably advocates. It embraces more Agricultural, Horticultural, Scientific, Educational, Literary and News Matter, interspersed with appropriate and beautiful Engravings, than any other Journal, rendering it the most complete AGRICULTURAL, LITERARY and FAMILY JOURNAL in America.

All communications, and business letters, should be addressed to B. D. T. MOORE, Rochester, N. Y.

For Terms and other particulars, see last page.

Rural New-Yorker.

A LEADER WANTED!

"A LEADER WANTED," says our foreman, within an hour of the time for putting this number of the RURAL to press—and the next morning after Thanksgiving, when one don't feel in the spirit of writing, at that. But a leader must be produced, immediately, whether we have or not the spirit or subject for an article—and it shall be forthcoming.

"A Leader Wanted!" Aye, not for this week's RURAL only, but for many institutions and positions in life—among the rich and poor, high and low, and the workers for the good, the useful and the elevating in all classes of society.

Commencing, for the sake of courtesy only, at the head—among the so-called great or elevated men of the land—and working its way down to the Rural Population, we will first say that a leader is always wanted at the head of the Nation who will regard the wants and wishes and best interests of the great mass of the People of the Country. A leader who will not only properly estimate and appreciate the importance of, but that will, so far as he consistently may, protect and encourage those engaged in the great Industrial Occupations of Life—Agriculture, Commerce and Manufactures. No mere party or sectional man can fill such a position, for it requires a far-seeing mind, of sound, discriminating judgment and statesman-like views, which comprehends the present wants, and position, and future prospects and destiny of the whole People and Country—East and West, North and South. In his Annual Message to Congress he should indicate, suggest and advise what is most needed for the advancement of the great interests already mentioned—and if a few thousand, aye, or a few hundred thousand dollars are necessary, why not appropriate it for such laudable objects, instead of squandering it on useless national defenses or political party favorites?

"A Leader is Wanted" also in every State—a man, or Governor, if you please, who shall regard the industrial interests of the whole Commonwealth, and especially those from which the People and the State principally derive their prosperity and wealth. If Agriculture is this interest, it should be fostered and cared for first, instead of second, third, or last, as is too often the case. No mere politician or one idea man is fit to guide the destinies of a State—even tho' as small as Delaware or Rhode Island—but the leader wanted should possess the ability to comprehend wrongs and abuses, and the nerve to redress them if in his power—and thus be a Governor of and for the People, rather than for a class of political or party spoils-seekers.

Leaders are wanted also in every County, Town, City and Village of the land—men who will prove themselves true conservative-progressionists, (an odd but comprehensive term,) and labor for the welfare of their constituents and districts, regardless of the temporary loss of personal popularity. The great trouble with our Municipal, County and Town officers generally, is that they are aspiring to higher positions, and dare not inaugurate any measure, however just or needful, which will displease "the party" or influential members thereof. The first question is not whether this or that measure is right, but whether it is politic, or will injure the official advocate personally. No such leaders are wanted by the great mass of the people everywhere.

Leaders are likewise wanted in every School District in the land. The best men should always be selected for School Trustees, the next best for Supervisors, the next for Assemblymen, and almost any body will do for Congress! If the youth are started aright, there will soon be honest and capable men enough for leaders in all positions.

Every Agricultural Society and Club—State County Town, or District—wants an intelligent, industrious and efficient leader, who will labor for the cause and community, regardless of personal comfort or popularity. And every Educational

Benevolent and Religious Institution wants the same—men of mind, independence and far-reaching views. Indeed, we might keep on for hours, did time permit, in enumerating where leaders are wanted in the various avocations and positions of life—but, fruitful and suggestive as is our text, we must close, thus relieving the reader, and furnishing the printer a hurriedly penned, often interrupted, but we trust not altogether non-suggestive or uninteresting Leader.

—Did time permit we would take the liberty of more than suggesting that at least one Leader is wanted in each Town and School District in the Union, (not already supplied,) to introduce the RURAL NEW-YORKER, which some discriminating people emphatically pronounce the LEADER in its sphere of Journalism.

AN INSECT INJURIOUS TO BARLEY.

Most of our readers who have grown barley in Western and Central New York for the last few years, need not be told that a maggot, resembling in color and general appearance the Wheat Midge, is found in great abundance in the straw, much to the injury of the crop and the prospects of the grower. The straw is pierced, and between each joint may be often found half-a-dozen or more maggots, each making for itself a circular cavity about the same diameter as the body, and several inches in length. The straw becomes dark-colored, brittle, as though scorched, and breaks into small pieces in threshing. This midge is also troublesome in the Eastern States, perhaps as much so as here. The following letter accompanied a collection of these perforated and broken straws, filled with maggots:

EDS. RURAL:—At the request of Dr. M. ORTON, one of the subscribers to your paper, I send you some specimens of an insect which is caused in the barley straw and nicely vanished over, in its natural state. You will find upon breaking open the straw, a small maggot. If you can inform me through the columns of the RURAL the name of this insect, or if it has been noticed by any of the agriculturists, who contribute for your paper, I shall be much obliged. The appearance of the barley before harvest, promised from 35 to 40 bushels per acre, but did not yield but about 25 bushels to the acre. The soil was a loam and well drained.—S. S. SALES, Pekin, N. Y., 1858.

A portion of the straw and insects we sent to Mr. STAUFFER, who, with his usual promptness, sent us the reply which will be found below. Some of them we have reserved, so that next season we may see the insect in its perfect state.

EDS. RURAL:—Yours of the 3d, with specimens of the insect injurious to the barley crop, in the Western and Middle parts of New York State, came to hand. I opened one of the baulms of barley-straw, and found two maggots embedded, measuring about one-tenth of an inch, of a straw color; under the microscope it appears like figs. 1, 2. I may be under the necessity of waiting till May or June, before the perfect insect will appear, which I doubt not, will be very similar to the wheat midge described in the RURAL, No. 27, Vol. IX, for July 3d, 1858. I am satisfied, however, that they are not identically the same species; I have examined the orange-colored wheat maggot, found in the groove of the grain. My figure differs somewhat, from the illustration given in your article above referred to, the difference may arise from a change of its state, as it approaches nearer to a perfect chrysalis. Fig. 3. is a copy from the specimen I examined, centrally, of an orange yellow, head and anus, with the two rings adjoining each dark colored, or nearly black.

Figures 1 and 2, Larvæ of *Cecidomyia Hordei*? 1, Straw-colored Barley Worm, or Maggot, one-tenth inch long, in the baulm. 2, Same Maggot, less advanced into the pupa state.

Figures 3 and 4, *Cecidomyia Tritici*. 3, Orange-colored Wheat Worm or Maggot, one-twelfth inch long, found in the groove of the grain. 4, Wheat Fly.

Fig. 5, the Haulm, after the larvæ or semi-pupæ have escaped.

Fig. 6, the Haulm blistered and contorted by the larvæ. 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 61, 62, 63, 64, 65, 66, 67, 68, 69, 70, 71, 72, 73, 74, 75, 76, 77, 78, 79, 80, 81, 82, 83, 84, 85, 86, 87, 88, 89, 90, 91, 92, 93, 94, 95, 96, 97, 98, 99, 100.

ous fly, similar, but a little larger, than the one described by SAY, as the mortal enemy of the Hessian fly, the *Euridomyia destructor*. The Hessian fly being the *Cecidomyia destructor*, Mr. HARRIS called his, *Euridomyia Hordei*, *Hordeum* being the latin name for barley;—so if it proves to be a *cecidomyia*, differing from the wheat midge, (*Cecidomyia tritici*) I propose to call it *Cecidomyia Hordei*. The genus *Euridomyia* (Wertwood) belongs to the family *Chalcididae*, parasitic like the *Ichnumonidae*.

No doubt the reason Mr. HARRIS got no specimen of the fly, was in not placing the larvæ upon moist soil, or in a flower-pot, so that those which were not oviposited on by the *Ichnumon*, might have buried themselves, since only those would develop that were preyed upon by the parasite, not the culprit that does the mischief, but its mortal enemy, as above remarked; having, I am fully persuaded, the same habits, as the wheat midge.

The *Cecidomyiades*, is a sub-family of the *Tipulidae*, having jointed antennæ *moniliform*, (like beads on a string), twenty-four-jointed, (or thirteen at least,) with verticillate hairs; they have long legs, without spines. The wings have but few nerves, and are carried flat on the back or roof-like when at rest. They are of a very small size, inhabiting many different plants, depositing their eggs according to the several species in young sprigs, the leaves, flowers, &c., causing galls similar to the *Cynipidae*, or distortion of the flower. There are numerous genera and species of this sub-family. The most injurious are those referred to.

When the larvæ of the wheat midge are kept in a box or vial, they lose their orange color and perish, moisture being essential to their transformation. I would advise those who are curious to breed the fly, to place or stick the baulms into the moist soil of a flower-pot, or the like, and, when the insects drop out to cover them—a bottomless jar, with fine gauze over one end, sunk into the soil, over and around them, will secure the fly when matured, and require no further watching.

Burning the stubble may destroy them, if done before the pupæ drop out. By cutting the grain early, and carefully collecting the larvæ in the chaff and dust separated from the grain, a large proportion of the ensuing year's brood may be destroyed. Wheat, by being kept in a close, dry place, over the year, when infected by the pupæ, (since it is the maggot only, that injures the flower and grain, when hatched from the eggs, while feeding,) will aid in their total destruction, by not affording them a lodgment in the soil; yet numbers may have found this lodgment, notwithstanding, during harvesting. Plowing deep is also recommended with a view to turn the larvæ deep under the soil. Thus we can understand some of the difficulties in the way of ridding our fields from this pest.

ADDENDA—THE POTATO INSECTS, AGAIN.

Fig. 7, *Passalus Cornutus*. a, a, the horn of the head, hence named *Cornutus*.

Fig. 8, *Baridius Trinitatus*. The *acarus*, Fig. 10, in the illustrations of my article in the RURAL of Nov. 6th, you name beneath "*Passalus Cornutus*"—this might lead to criticism, as you should have said—"parasitic on the *Passalus Cornutus*." This latter is the name of a large species of *Coleoptera*, among the *Lamellicornia* beetles, with a horn on its nose, bent forward nearly at a right angle.

The Potato Weevil, fig. 5, c, was, I have since found, the "*Baridius trinitatus*" of SAY, the same insect which Miss MORRIS communicated to Mr. HARRIS, of which he published an account in the *New England Farmer*, some years ago.

I send you two drawings, you may make any use of them you please. JACOB STAUFFER, Lancaster, Pa., Nov. 8, 1858.

EXPERIMENTS WITH WHEAT.—To raise a stronger stem and a crop less liable to fall, J. B. LAWES, of Rothamsted, Eng., says, in a recent London Journal, that he tried the experiment of sowing early—the last of August—and feeding with sheep during winter and spring, checking thereby the leaf and stem, and extending the roots, hoping thus to obtain a plant which would resist wind and rain. The effort met with little success. "At one time," he says of another experiment, "I was led to hope that we might by some chemical compounds increase the strength of the straw; but I have been entirely unsuccessful, and do not anticipate there is much to be done by other experiments." In regard to thin seeding for this purpose, he says that by keeping the plants further apart, so as to admit more light, a stronger stem may be obtained, but at the expense of increased labor in weeding, and, generally, a decrease in the quantity of the grain.

CONNECTICUT ON THE CATTLE QUESTION.

DURING the Fair of the Connecticut State Agricultural Society, the members thereof held several meetings for the purpose of discussing matters of general interest connected with their vocation, and at one of these gatherings the query, "What is the best breed of horned cattle for this State?" was propounded. The question of the respective value of the various breeds has had brief notice in the RURAL lately, and it may be well to look at the views of farmers in the "land of steady habits," compare them with our own opinions upon the subject, observe wherein we agree or differ, and draw practical conclusions from the thoughts presented. To this end we give, in the following condensed form, the ideas thrown out by our Connecticut brethren:

Mr. CLARK, of Hartford, remarked:—For myself, I must say that I am in doubt which breed of cattle is most suitable. Where there is rich pasture, there is no doubt the Durhams are the best. The Alderneys, for men who keep but a single cow, are undoubtedly valuable. We have not had much experience in Ayrshire stock in this State, but I am satisfied it is a breed well suited to our State, for they are excellent milkers where they are most commonly raised and kept in Scotland. The cows there average 20 quarts a day. But taking everything into consideration, I am satisfied that the Devons are the kind for universal use.

JACOB U. BLAKESLEE, Watertown.—The first Devons were brought into the State in 1819. Since then the quality, both for milk and meat, has been much improved. It is true they will do well upon shorter feed than any other variety, but it is bad policy to overstock land. If properly bred, Devons are good for milk, and superior workers.

Mr. LINDSEY, of Meriden.—I have seen something of the beef of England, and never heard that Durhams made beef of as good quality as Devons. The reason why Alderneys produce such good milk and butter is because they are better fed. Pure-bred Devons here are so valuable that they are not used to make beef. I can make beef at less price upon eight legs than upon four. I don't want cattle of a very large breed. I have never seen any milch cows equal the native stock of this State. I mean by native, the stock long bred here without crossing with any imported stock.

HENRY BILL, of Norwich, preferred the Ayrshires for any use. To say which is the best breed for the State we must know what we want cattle for. Upon the richest farms I think Durhams best, because beef can be made at the least cost. The imported Devons are not as good for milk as the natives. But calves of a good native cow are not sure to be good. I think the Alderneys too delicate for general use. I prefer Devons to all others for oxen. The Ayrshire cows are the best for use to sell milk from in a city market. If you want to make beef you must take breed suitable for the purpose.

Mr. CATLIN, of Hamilton, thought that the best cattle to be found in the State are in Litchfield county, and all are mixed with late importations of the Devons, and the best oxen here are seven-eighths Devon. We are obliged to use oxen in this State on the hilly land, and the great desideratum is to get that sort of stock that will breed the best oxen. Now, what breed is best for this purpose? No doubt it is a cross of the Devon.

Mr. HART, of Litchfield Co., says his practice has been to feed calves upon oil meal and whey.—Have raised thirteen this year upon 700 lbs. of oil meal, and that was the only cost, and they did as well as other calves raised upon new milk. It cost \$2 a hundred pounds. Fed the calves from the time they came, 1st of April, till about the 1st of June. It is a general opinion with us, that if we had taken the same pains to improve our native stock that have been used to improve imported breeds, we should have had a better breed than the imported one. Cross Devons, Durhams and Herefords upon natives. My average this year is 425 lbs. of cheese and 50 lbs. of butter per cow. The best cows are made up of a mixture of different breeds. In feeding oil meal, the calf must be highly fed at first, and full fed after a week old.

Mr. BLAKESLEE corroborated the statement of the last speaker about the value of oil meal, but preferred to feed the meal to the cow and give the calves skim milk. Preferred to raise calves in an economical manner rather than let them suck the cows, as they make better animals.

Mr. OSBORN, of Fairfield Co., remarked that at the State Fair one year ago, there were many cattle entered as natives, but there was no premium offered. I am satisfied that we could improve the natives, and make better stock for this State than any breed of imported cattle.

Mr. HART considered the last importation of Devons much the best for milk. In offering prizes, we required the Devon and Durham oxen to compete, and the Devons always won the prizes. I have worked both grade Devons and Durhams, and find the Devons outwork the Durhams very far.

FEEDING OUT CORN STALKS.

SPEAKING of "racks and manglers," last winter, (RURAL, March 19, 1858,) we remarked:—"Put corn stalks in a rack, and the animal will pull out one every time it gets a mouthful, and then drop it to pull out another," and asked how to remedy the matter. One correspondent told us he had heard of a machine going by horse power, "which picks and tears corn stalks into feathery fragments," in which state they could be fed like hay, and, his plan of cattle-boxes was the best ever got up,—(we think it was an excellent one.) Another advises manglers and stanchions, where, when pinned in by the head, cows couldn't take stalks out, "save by eating them out." Another, still, told us we were entirely behind the age in not keeping our stock stabled—all leaving me just about as bad off as before, as far as information was concerned, or anything readily and cheaply put in practice out-of-doors.

Meanwhile, we have had time to experiment somewhat on the subject, and therefore have gathered some "notions" of our own, which we will jot down for those interested in feeding out corn stalks.

Now-a-days, many a farmer raises nearly enough corn-fodder, if properly cured and saved, and then fed out without waste, to winter all his cattle. Of the curing and the saving, we have recently (RURAL, Oct. 2, 1858) had our say in your columns, and we then also denounced the practice of feeding out along the lanes, wasting the refuse stalks as well as the manure made by the animals, thus fed away from the right place—the barn-yard.

The best time of feeding corn stalks, is when the weather is freezing cold, and the ground dry and solid. Perfect economy can then be practiced by a little attention to manner. Stock then have good appetites—they are far less particular than in warm weather, as to what and where they eat. In such weather, we give them all the corn stalks they will consume cleanly, and it is a treat to see them clear the yard. In such weather, too, we allow our old sheep to join the cows in eating their fodder—taking pains to scatter them in small bunches, and so freely that the cows have little provocation to injure the sheep. We never had one seriously hurt by hooking—indeed, the old ram keeps our cattle rather afraid of everything wearing wool.

At all times the yard should be well littered, but this is especially important when thawing weather occurs. Still, the yard is not a perfectly economical place for foddering, although it can be made a very comfortable one at such times, and answer tolerably well. What is lost as fodder is saved as manure, and helps to litter the yard. We feed less stalks then and more hay, and allow them to fill up at the straw stack. We usually have an abundance of stalks, so that it is our best policy to make the most of them, and still not to stint our stock.

There is not the least doubt in our mind that it is the best policy for the farmer to provide stables with stalls and manglers, for feeding his stock in wet and stormy weather, allowing them the run of the yard—with sheds attached—a portion of the time. This we intend to do, the present winter—having been advised thereto by some of the best farmers in the country, and our own experience bringing us strongly to the same conclusion.

Some people have advised cutting corn stalks for feeding stock. We are strongly of the opinion, however, that there are quite a number of cutting machines—now rusting in out-of-the-way corners—which have been used for this purpose, but are now thrown aside. They don't pay. The chief advantage is that there are no long stalks to interfere with getting out the manure. But a very little more of the fodder is consumed, unless it is steamed and mixed with meal—an operation few farmers will go into for more than one season. As for the manure view of the question, it might pay with cheap power and perfect machinery, to cut hay, straw, and stalks, that the bother of long manure might be entirely done away with—the contents of the yard being fit at once for mixing with the soil.

FOR SALE!

A "DRAINED HARD-PAN" farm of 150 acres, "up in Steuben," ten miles from market, sixteen from the county seat, and still further from Pearl Creek! Said farm has been assessed at near \$60 per acre, and dear at that. Price and terms of payment made easy. The owner is tired of work, and proposes to "fly the cat hole," and give up the unequal contest with the many natural obstacles to profitable farming. He will migrate to distant parts as soon as he can dispose of his effects, but will not stop upon "average Livingston county land," but will proceed at once to the Tropics, to pick and eat of the spontaneous productions of the earth until he is satisfied, and then roll on his back, with his face to the sun, till he gets hungry again. Won't H. T. B. go along? It is just the spot for all such as have a keen eye to large returns from little labor, and will pay more than "four per cent."

on cost of getting there. Hurra for the Tropics, say we! Let us even abandon our hills and hard-pan for forests and wild beasts, and our dwellings to the owls and the bats, if we can find no one green enough to buy of us; let us give up that sickly sentimentalism which teaches that labor is a blessing, and that that man is a public benefactor who causes two blades of grass to grow where before there grew but one; let us away with the folly of being generous in our dealings with mother earth, and henceforth seek to sponge a living from her without "stated contributions" from unwilling hands. In short, let us go where we can live without expense and without toil—where nothing that we do will fall to "pay," for the simple reason that we'll not be doing it. Hurra for the Tropics! Adieu to ditching! Everlasting gratitude to him who from the fullness of his great heart, has kindly stepped in to save us individually, and save us as a nation from tumbling "neck and heels" into hopeless and irredeemable bankruptcy! And yet a higher meed of praise for that disinterested kindness which leads him to instruct us—"up in Steuben and Cattaraugus"—as to the management of hard-pan land!

BEES AND BEE-HIVES.

MY EXPERIENCE—NO. VI.

THE value of the "Changeable Hive" is based upon the following principle. Each young bee, when it first hatches from the egg, is nothing more nor less than a worm. When it receives the necessary food from the bees, they seal it over; it will then spin a cocoon or line its cell with a coating of silk less in thickness than the thinnest paper; this remains after the bee leaves it. It is evident, therefore, that after a great number have been reared in a cell, and each has left its cocoon, that such cell must be somewhat diminished, although the thickness of a dozen could not be measured; and when so reduced as to dwarf the bees, these old cells need removing, that the bees can replace them with new ones. But how this operation shall be performed is just what the majority of patent-venders are ready to tell you—they have a hive for the express purpose. They could sell a recipe to do the thing scientifically, the benefit of which would be many times, on the principle of a surgeon cutting off your head to get a chance to take up a small artery according to system, or show you a round-about way of half a dozen miles to accomplish what as many rods would do! But this is supposing the thing to be necessary. I shall discourage the operation as far as possible. I have found it unnecessary, and, for the last ten years, have not changed comb for being old. Not one stock in five hundred lasts long enough to have the cells reduced, to damage them. It is unnecessary to tell me that the stock runs down because there is not room in the cell to develop the bee! The proportion that fail the second year is as great as those at eight years old or more.

It is somewhat amusing to look over the different variations in design to accomplish this feat of compelling the bees to make new comb every two or three years—professedly to prevent rearing dwarfs instead of full-sized bees. This class of patent venders have done more injury to the bee-keeping community than if the diminished size of a cell had never been thought of. They have not only exposed their own ignorance of the first principles of economy in bee-culture, but have induced their customers to adopt a wasteful course of practice. It is plain to some who have had experience, and have no interest to blind their judgment in this matter, and therefore ought to understand it, that every time a colony of bees fill an ordinary sized hive with brood combs, that they would store at least twenty-five pounds of pure surplus honey in boxes during the time, if they could have had their old combs! I never knew a vender of a hive of this kind, who allowed that combs would answer longer than three years any way—many of them two, and one recommended changing every year. Take the longest term, (three years,) there must be three changes in nine years, which has cost, besides trouble, at least seventy-five pounds of pure surplus honey, without any equivalent, as comb nine years old is just as good for breeding as that but one! I have combs used for brood much longer than that, and I challenge the whole paternity of these venders to pick out by the size of the bees, those stocks containing old combs! This frequent renewal of combs being proved to be unnecessary—for it seems to me every person having no interest but the utmost thrift of his bees, must see it—what is gained by so much useless expense?

As there are still other objections to be urged against changeable hives, I will describe one or two on this principle. It is a sectional one, of course. The simplest form consists generally of about three boxes, one above the other, or two somewhat long ones placed side by side, the third one on the top of them. The first is made all of one size and shape, say about one foot square by five or six inches deep inside. The top of each one has several small holes or one large one through it, or has cross-bars about one inch wide, and half an inch apart, so that when the three that form the hive are put together, the bees will have free passage through the holes or spaces. When all are full the upper one is removed, and an empty one put under the bottom, to be filled in turn, every year. In this way, all are changed and the combs renewed once in three years—very easily and quietly done, securing at the same time a large box of surplus honey. This is as far as it is wished to have the subject investigated, and many have never gone beyond this point. The objections to these hives for wintering bees have already been given—viz, the breeding apartment is too small to hold sufficient stores for winter, and the bees might have to go to another for food in frosty weather. It is objectionable on another point—the surplus honey can never be pure, as each section or box must be used for breeding, and every cell thus used will contain cocoons corresponding to the number of bees reared in it. Also pollen or bee-bread is always in the vicinity of the young brood. Some of this will remain sealed up with the honey to please the palate with its exquisite flavor! How much better to have all surplus honey stored in new, white, pure combs, and free from any foreign substance—as it will be with proper management. But we must postpone our notice of the other variety for another article.

St. Johnsville, Mont. Co., N. Y., 1868. M. QUINBY.

THE CHINESE SUGAR CANE—EXPERIMENTS.

THE results of the past season's operations with this new saccharine producer are beginning to find their way to the *saccharum*, and the probabilities are that, between taster and reader, the corps editorial are in exceeding danger of being metamorphosed into admirable specimens of "linked sweetness." However, we will assume all risks in this matter, and will not longer keep Rural readers from the "feast of good things" given below.

THE SORGHUM IN INDIANA.

Messrs. Eds.—The age of cheap sugar, of which our friend W. B. P., of Prattburg, N. Y., speaks in the Rural of Nov. 6th, has not merely a dawning existence, but has already spread its frugal influence upon thousands, and especially upon your correspondent who has not only made syrup but good sugar.

We raised "cain" on one-fourth of an acre every Monday morning, with shovel-plow and hoe. Planted in rows four feet one way and 1½ feet the other. Part was suckered, leaving four main stalks in a hill. The part suckered produced larger stalks and, I think, more and richer juices on the same amount of land than that which was not suckered.

The machine we used was wooden, the rollers covered with sheet iron. We separated a portion of the stalks at the fifth joint, and used the juice of the butts for the purpose of making sugar. LOVERING's method was followed as closely as in experience, lime, eggs, and a "big kettle" would permit. Not having the proper instruments by which we could with certainty calculate the point when to stop boiling, we necessarily resorted to the usual method of getting at such things—that is, by guessing. Happily the mark was hit, but not in the center. It granulated in a short time, but would not separate. Draining would not do it, and after we had exhausted the thousand and one methods prescribed, to no purpose, we concluded that if gentle means would not accomplish the end, force would; so putting the mass into a cloth strainer, a little pressure brought out the thick gummy substances and left dry sugar.

I will assure W. B. P., of Sorghum physis notoriety, that it is a settled fact with us, that this syrup, and sugar not excepted, will keep north of "Mason's and Dixon's line," and I imagine that being taken over to the other side it would not suffer either by exposure to the atmosphere of that climate nor by comparison with its best productions. Now I would advise friend W. B. P. to take a short trip out West, and enlarge his experience—in doing so, if he will take the trouble to visit the "domestic" of the subscriber, he will show him as fine-flavored sugar as ever sweetened the palate of man, which will not leave with him a "pumpkin taste"—as did his "Fidget Specific"—but taste every way worthy of an article of this kind.

M. R. B.

Pretty Prairie, Ind., 1868.

THE SORGHUM IN PENNSYLVANIA.

EDS. RURAL:—I suppose you, with some others, are very anxious to know how we succeed with our Sorghum this fall. It can be answered in a few words. Much better than last year; beyond what we had dared to hope. There have been several hogheads of Syrup made in this vicinity, and of a much better quality than was manufactured last season.

In consequence of the wet weather in the spring, it was planted late; and many who had intended to plant were unable to do so. Then we were favored with extra dry weather, which out our cane short at least one-third, but it is generally thought to be much sweeter. Aside from all these drawbacks considerable seed has matured. I have made no estimate of the expense, per gallon, but I should think about 25 cents. The fodder procured from the suckers and from the leaves stripped from the stalks, fully paid all the cost of planting and hoeing. Cows thrive upon it exceedingly well. The yield varies from 150 to 300 gallons per acre. Of course the richer the ground the greater the yield. Our syrup is equal to the best made elsewhere. I will venture the price of ten subscriptions to the Rural, that our much esteemed friend of "rolling pin" notoriety, with all his erudition and profound sagacity cannot tell the difference. I am a "Sorghum defender of 1868," and there are more of the same sort here; and 1869 will see a great deal more planted in this region than any previous year. This will prove something. All the "fidgets" and "pumpkins," and stereotyped puffing and crying down, don't frighten us in the least. I should have replied to "W. B. P." long ago, but I thought like one of old, "he is joined to his idols let him alone."

I have given you a brief statement of our progress in the sweetening line, this season, for which I shall doubtless receive several blasts from the able pen of our Prattburg worthy, but if it will in the least quiet his nerves, let him give full vent to his volubility, as if it will relieve him of that doleful complaint, the "fidgets," we give him the full privilege to "pipe away."

Susquehanna, Pa., 1868.

WM. DOOLITTLE.

THE SORGHUM IN WISCONSIN.

Messrs. Eds.—Sugar Cane, its cultivation and manufacture into sugar and syrup, has indeed become an interesting topic of conversation among the farmers of our young and flourishing State, Wisconsin. The success with which labor has been rewarded during the past season, while experimenting upon a small scale, in the raising and manufacture of the cane into sugar and syrup, has already created in the enlisted farmer a renewed energy and faith, that will tell wonders in *Sorgho* culture. Yes, and even the close-listed ones who are ever found in the back ground of any new enterprise, where dollars and cents are at stake, are being daily convinced after "seeing the elephant" that there is at least some sweet, if no money, in the speculation, and they, too, declare that they will raise cane another year.

"Cane sweet" is evidently bound to become a home production of the North and West—this seems plainly so, judging from the experience that *Sorgho* culturists have had this season. It has been raised in almost every portion of our State with decided success. Two or three samples of sugar and some ten or twelve of syrup, manufactured from the cane, were on exhibition at the State Fair, and attracted much attention. Mills have been "got up" for expressing the juice, arches have been built, pans have been made for evapo-

rating purposes, and the *modus operandi* of the sugar and syrup camp has been practically illustrated in very many instances, excepting of course, the "variations." The many results go to prove that it will be a profitable as well as a very convenient and sweet occupation in its season. Sugar, syrup, and vinegar, are derived from the sugar cane, besides the excellent fodder from its leaves and seed.

From what I have learned by experience and observation, I have come to the conclusion that good crops of cane will produce about two hundred gallons of syrup per acre, or fourteen hundred gallons of juice—it takes about seven gallons of juice to make one of good syrup.

O. F. D.

Palmyra, Wisconsin, 1868.

THE RURAL—FALL PLOWING.

EDS. RURAL:—I have been a constant subscriber to your valuable paper, since its first issue—and amid the various publications that come into my house, there is none that is looked for with so much anxiety, or whose pages are perused with so much interest. There is, in my estimation, no periodical published in our State, that creates so salutary an influence—both morally and intellectually—as your valuable paper. It treats not alone of agriculture; but has a high tone of moral and intellectual culture, which serves to render it one of the most interesting family papers now published. But my object in writing this article is not so much to eulogize the Rural, as to give you my views—the result of practical experience—in reference to fall plowing, deep plowing, and plowing under clover.

Fall plowing, according to the mode of husbandry formerly practiced in this section, was not very generally approved; but now, in consequence of the ravages of the midge, wheat has become an uncertain crop, and farmers have to turn their attention to other more remunerative crops. Spring crops have seemed to promise the most remuneration; but Spring Barley seems to be about as uncertain, as regards the midge, as the wheat crop. Oats and corn will, I think, be the principal spring crops in this section, at least, until the insect wheat enemies cease their depredations.

It is important that spring barley should be sown as early in the spring as will answer, in order that it may escape the midge. Oats, also, should be sown very early to insure a good crop. It becomes imperative, therefore, in order to get in as large a breadth as most farmers wish, to have the ground plowed in the fall. But any further preparation, instead of being an advantage, would be an actual detriment. The furrows should not be turned over very flat, as the earth then becomes too firm and compact—much the same as if rolled down, or harrowed smooth, with a harrow—should be left partially edgewise. It is thus rendered more friable, loose and mellow, consequently more easily and better prepared for the seed in the spring than it would be if dragged or cultivated in the fall. The action of the frost upon the ground left in the furrow is found to more completely destroy the tenacious qualities it possesses than if left flat and smooth. Although it now seems necessary to plow in the fall for spring barley or oats, yet I would not recommend such cultivation for corn, unless it was a heavy, tenacious soil, and then, for the reasons above stated, it, perhaps, would be better. If the ground on which corn is intended to be planted the coming season, is sward-land, and infested with wire-worms, I would not by any means advise to plow in the fall, but just before planting, giving only time to suitably prepare the soil—even two or three weeks difference in the time of plowing made more than one-half difference with me in a crop of corn. It would be folly to think of planting the same ground to corn the ensuing year without plowing deep, and very late in the fall; for the wire-worms would most certainly destroy the crop. Fall plowing is a very good way to eradicate quack-grass, or Canada thistles, and cultivate the surface the ensuing season, without disturbing the roots. Quack-grass, especially, if turned under ten or twelve inches deep in the fall, will be very easily eradicated, by cultivating the surface thoroughly, as the roots of this grass will not grow unless near the surface.

Clay land, especially if wet, if intended for a spring crop, should be plowed deep in the fall, for it is more easily pulverized and brought to a fine tilth. Such is not the case with light sandy soils, but an actual detriment to the productiveness of the soil; for unless protected by the sod, it will be, more or less, blown away.

But I see I have extended this branch of my subject to some length, therefore, will leave the other topics proposed for another article.

W. H. H.

Scottsville, N. Y., 1868.

ABOUT UNDERDRAINING.

EDS. RURAL:—In your issue of the 6th Inst., I notice an article signed "H. T. B.," purporting to answer the inquiry, "Does Underdraining Pay?" Now, I have one or two things to say on this subject. In the first place our learned friend (judging from his letter) must have traveled over a considerable portion of this continent, and perhaps has done some draining, perhaps a small farm of 10, or maybe, 50 acres. No, he refers to Cork, and I am led to believe his ancestors came from that place. In some way or other, he has worked into that cranium of his the idea that farmers think they must drain all their land. The idea is preposterous—probably but ten acres on a farm of one hundred need draining—and he goes on counting up the expense to the tune of \$45 per acre. Verily! I must say this man of figures outstrips all his predecessors.

I should like to ask the gentleman what he means by "a general system of draining." In his article he says, "he is not opposed to draining."—No, I should think not! Yet I am under the impression that he is not so foolish as to lay out \$45 per acre, which he says it will ultimately cost. Better let such land lie, and turn fillbuster, (or correspondent of some periodical,) or follow any business more lucrative than that of farming.

There is one place, I think, the gentleman never has visited, and that is Cattaraugus County, when he speaks of a man "boiling a mile from the four-corners, two from the store," &c., &c. I think the inhabitants of that section might justly feel indignant at such gross insinuations against their gen-

eral pleasure of living. I hope they are of a more genial turn of mind, and do not allow their heads to be filled with such morbid insinuations as he has set forth in his article. If he wishes to see farms drained as they ought to be, let him visit Niagara County, and I will show him farms drained at a much smaller figure than \$45 per acre. Yes, and I will show him men whose knowledge concerning draining lands, is fully equal to his, who will assure him that land can be drained at a much less cost than what he has placed it. "He wishes to point out the circumstances under which it will pay"—also says, "mistakes are made in selecting lands." Does he not know that the best of lands always command the highest prices? Well, then, is the poor man going to lay out all his money in a few acres, when he can buy others a little poorer, and, as he begins to cultivate the same, improve them? No. These are my opinions. I may be wrong, and am open to conviction—but his article does not convince me by a great deal.

Lockport, N. Y., 1868.

C. T. R.

INQUIRIES AND ANSWERS.

DRESSING SKINS.—I saw several recipes in the Rural New-Yorker for Dressing Deer Skins, and I think very good ones, and I wish that you or some of your correspondents would inform me of a good method to dress Deer Skins and the skins of small animals with the hair on, as I have some I should like to dress for a coat or other use.—A. T. S., Hillsboro, Ill.

WHAT AILS THE PIGS.—I wish to make an inquiry through the columns of your valuable paper, in relation to a disease with which my hogs and more particularly my young pigs, have been attacked occasionally, for the last two or three years. The symptoms are first violent coughing, loss of appetite, and, lastly, difficult breathing. I have lost a number of very fine shoats with the above disease. Any one of your numerous readers that can enlighten me upon the subject, will receive my warmest thanks.—J. B. Wilson, Ridgeway, N. Y.

REMARKS.—Mr. Wilson is hardly explicit enough in his detail of the symptoms to enable us to speak with certainty as to the disease. It is more than probable, however, that inflammation of the lungs, (Pneumonia,) is the malady. The early symptom is coughing. A cough in a hog is always a suspicious circumstance, and should be early and promptly attended to. The disease is rapid in its progress. The animal heaves dreadfully at the flanks; he has a most distressing cough, which sometimes almost suffocates him, and he refuses to eat. The principal guiding symptom will be the cough getting worse and worse, and becoming evidently connected with a great deal of fever.—In many cases congestion takes place in the lungs, and the animal dies in three or four days; in others he appears for a while to be getting better; but there is a sudden relapse, a frequent, dry, husky cough comes on, there is little appetite, rapid wasting, and the hog dies. The first thing that is to be done is to bleed, and the most convenient place to bleed the hog is from the palate. If an imaginary line is drawn from between the first and second front middle teeth, and extending backward an inch along the palate, and the palate is there cut deeply, with a lancet or fleam, plenty of blood will be obtained. An assistant may easily open the mouth sufficiently for all this by means of a halter or stout stick, but beyond this the owner is an awkward patient to manage. He will struggle obstinately against every attempt to drench him, and the inflammation may be aggravated by the contest.—It will, therefore, be necessary in the majority of cases to endeavor to cheat him by mixing his medicine with his food. The following may be given: Take digitalis, three grains; antimony powder, six grains; nitre, half a drachm. Mix, and give in a little warm swill, or milk, or mash.

In the greater number of cases the animal will readily take this; but if he is so ill that nutriment of every kind is refused, he must be drenched.—This should be repeated morning, noon, and night, until the inflammation is abated. A purgative should quickly follow, and we have those for the hog which are mild as well as effectual, and from which no danger can result. The Epsom salts may be given in doses of from one to three ounces, and they will communicate a not unpleasant or unusual flavor to his broth or swill.

MORE ABOUT THE DITCH PLOW.—I cannot give the definitions as well as others might, in regard to the ditch plow, but fearing "T." might not get an answer as soon as he wished, I give my ideas of it in short. There is no patent on it, and I do not know as there is any advertisement of it. It is composed of a strong wooden beam, with a gauge-beam to which to attach the team. The handles are affixed to gauge to the depth of the ditch, so that the person holding can walk with one foot on either side of the ditch. The team travels one on each side, being coupled to an even seven or eight feet long. The plow is a small cast-iron one, (with a determined will to go down,) bolted to the lower end of an iron standard, which latter is bolted to the side of the strong beam. The standard is long enough for the depth of the ditch. It reduces the labor of shoveling, which, I think, is one half, and the hardest part at that. The maker's name of the one I used is HARVEY STONE, of Reed's Corners, Ont. Co., N. Y.; cost my neighbor \$13. He bought it long before the panic. The owner of this plow told me that Mr. LAMFORT, of Canandaigua, keeps the iron fixtures for the plow. I have heard to-day that DAN PRATT, of Prattburgh, keeps a similar kind on hand.—WM. P. S., Seneca, N. Y., 1868.

PROFITS OF BEE-KEEPING.—One year ago I wintered over sixty-nine swarms of bees in good condition, and from these I took the past summer and fall 2,535 pounds of pure box honey. Of this 2,400 pounds were sold at Canandaigua for 15 cents per pound to be shipped to New York. Some of my best stocks made six boxes full, weighing 72 pounds of honey. I got twenty good young swarms which I value at five dollars each. It was a poor season for swarming, and not so good for making honey as some others have been. Since I have kept bees I used the kind of hive recommended by Mr. QUINBY—a common box hive made 12 inches square, inside, by 14 deep, with ten inch holes in the top, then the boxes and a cap over them as described in his "Mysteries of Bee-Keeping." As for millers and worms, the best and only way to get rid of them is to pinch their heads.—EUGENE LEWIS, Reed's Corners, Nov., 1868.

Rural Miscellany.

THE AMERICAN INSTITUTE announces an Exhibition of Fat Cattle, Sheep, Swine and Poultry—competition open to the whole United States—to commence Dec. 15th. See advertisement.

BAREY'S SYSTEM APPLIED TO CATTLE.—The groom of the Duke of Portland, James Thompson, after taking a series of lessons under the teaching of Barey, applied the training system to a vicious Alderney bull, and succeeded in making the once terrible brute as "tractable and docile as a child."

A VIRGINIA gentleman proposes to donate \$20,000 for the erection of an Agricultural College in the vicinity of the University of Virginia, on condition that the farmers of the State will render the donation available for the purpose, by contributing an additional sum of \$50,000.

SHELTERING MANURE.—Stable manure kept under shelter, and properly mixed with absorbing substances, such as leaves, straw litter, &c., is of much greater value than when exposed in the open yard. An analysis made at the Royal Agricultural College of England, shows that it contains more than double the quantity of nitrogenous matter, and the same of salts, containing organic and inorganic matter, soluble in water; while of potash and soda, the sheltered manure contains .08 per cent, and the sheltered 2 per cent.

WISDOM IN SELECTION.—A great deal of skill and sound judgment may be exercised by the farmer in selecting the crop suited to his soil—in selecting variety and seed—in choosing the right time to plow, plant and harvest. There is a call, too, for wisdom in selecting of the knowledge obtained from books and papers, that best suited to our soil, climate and circumstances. Unless a man has sound judgment in selecting, it would be better for him to follow the example of a poor farmer we have heard of, whose crops were always poor, while his neighbor's, on the next farm, were always good. He resolved to do as his neighbor did—plowing, planting, cultivating at the same time, and, as near as might be, in the same manner. He did so, and had equally good crops.

THE IRISH POTATO CROP.—The Banner of Ulster says:—"We have had communications from the most intelligent farmers in this province, relative to the potato crop. In some cases it is said that one-third of the whole yield is more or less diseased; in other instances the destroyer has seized about one-sixth, and in more favored localities, the total effects of the disease have not extended to more than one-tenth of the aggregate. It must not be forgotten that evident signs of the disease being in course of dying out, are to be seen in the potato lands. The disease is this year much less virulent than it was in the early seasons of its existence, and the sound portions of the crop are of a quality at least equal to the finest grown in the days which preceded the advent of the potato rot."

A GOOD LINIMENT.—Mr. THOS. E. HOOKER, of Murray, N. Y., gives us the following recipe for a Liniment which he regards, from long experience in its use, as the best known for sprains, bruises, flesh wounds, &c., for man or beast:—One pint of alcohol; one oz. of origanum oil; one oz. worm-wood oil; one oz. hemlock oil; one oz. camphor gum; four ozs. of aqua ammonia. Add, if you have it, the liquid of one beef's gall. Mix, and it is immediately ready for use.

—Mr. HOOKER avers that one recipe which he obtained in the Rural, (that of raw linseed oil for Garget in cows—to be rubbed on the bag on the first appearance of the disease,) has been worth to him a life-time's subscription, and trusts the above will prove equally valuable to many of its readers.

ORIGIN OF THE CARTER POTATOES.—"About 30 years ago, more or less," remarks the Springfield Republican, "JOHN CARTER, a resident of Savoy, in the county of Berkshire, experimented for the purpose of the improvement of potatoes by planting potato balls, and at harvesting the first year he found that he had advanced one step towards bringing out a new potato. He, therefore, the next year planted the seed raised the first, and so on for several years, till he produced the potato now distinguished as the 'Carter.' Mr. CARTER died soon after, and therefore did not enjoy the full glory of his discovery. He was the owner of a small farm in Savoy, which he tilled; a portion of his time, however, he devoted to mechanical pursuits; he worked at repairing jewelry, somewhat, also, at repairing tin, brass, and copper ware and was what was termed in those days, a 'tinker.' He was an honest, industrious man, but lived and died poor. Although Mr. CARTER's life was but little known, he will be gratefully remembered by millions of potato eaters."

ORLEANS Co. AG. SOCIETY.—Some time since Mr. President BAILEY informed us that this Society had resolved to have the Annual Address, and also to pay the premiums awarded at the late Fair, at the Annual Meeting, in the belief that there would be more interest and a larger attendance than usual. We are glad to learn that these anticipations have been realized—that the Annual Meeting, held at Albion on Monday week, was well attended, and that the address by Hon. T. C. PETERS, on the subject of Drainage, was received with evident satisfaction. The Society is in a prosperous condition, with harmony among its members, and a disposition to work in the right way. The Society elected the following officers for the ensuing year:

President—T. C. BAILEY, Albion; Vice-President—Ezra N. Hill, Holley; Secretary—Oliver Morehouse, Albion; Treasurer—Arad Thomas, Albion; Directors—Henry Kerby, Clarendon; John Hadstead, Carlton; Guy Sherwood, Shelby; S. R. Howe, Barre; Clark Hall, Albion; L. Bates, Ridgeway.

—The plan of having an address at the annual meetings of Ag. Societies has already been commended in the Rural, and we are inclined to think that many Societies would find it advantageous to pay premiums at the same time. It would afford opportunity to correct mistakes, and secure the presence of those who ought to elect officers.

Orchard and Garden.

IOWA ISLAND.

In the Hudson River, near its Western bank, and a mile or so above Peekskill, is a little island containing more than a hundred acres, though a portion of it is so rocky as to be unfit for cultivation. This is called IOWA ISLAND, and on it, solitary and alone, "monarch of all he surveys," lives one well known to the Horticultural world, Dr. C. W. GRANT. We had long desired to visit this island and its proprietor, and on our return from the Pomological Meeting in New York, we stopped at Peekskill, where we found the Doctor awaiting our arrival, with a fine boat, and after a pleasant ride of a mile or two on the bosom of the beautiful Hudson, we landed at Iowa, ready to examine the new grapes, which, from the specimens sent to all our Horticultural exhibitions, we knew the Doctor grew in perfection. Still, we were not prepared for such a glorious exhibition—all the new grapes that we had only seen before on the tables at shows, here we beheld under far more favorable circumstances for forming an opinion as to their value and productiveness. Here we found the *Delaware*, not in single clusters, but by bushels, and the berries and bunches of a much larger size than we had supposed this variety could be made to attain. Instead of the slender growth of wood, as we had usually seen young plants make, here we beheld canes of the present season's growth, sixteen feet long and half an inch in diameter, and these not single branches, but a dozen or more from the same root. On one vine, four years planted, we counted seventy clusters.

The *Diana*, too, on this island, was exceedingly fine, in every way, and we made up our minds that we had never before seen this grape in its highest perfection. We measured canes twenty-three feet long and an inch in diameter. The *Rebecca* is a rather slender grower, but we measured canes half an inch in diameter, and eighteen feet long. The young vines were fine, and to-day we have opened a box sent us by the Doctor, and found it to contain a young *Delaware* vine, with a basketful of fibrous roots, some of them three feet long.

The *Diana* and *Delaware* have been improving for several years, growing better and larger each year. The stock, or constitution, the Doctor argues has been injured by excessive propagation, from which the vines are gradually recovering. On this point we give an extract from his Catalogue.

"One of the evils to which now and desirable varieties of plants of all kinds are subjected is excessive propagation, either by taking as many layers as the vine can be made to produce, or by using all of the wood that can be made to grow, in which cases the vines will always be imperfect or worthless; and consequently the reputation of the variety damaged or destroyed. Of this, the *Diana* has been a marked example, and those who have experienced its feeble growth, unproductiveness, and small bunches from the dwarfed specimens first sent out, behold with incredulous surprise the exceedingly vigorous growth, which is but its normal development, and such magnificent bunches of fruit as have, this season, been eagerly taken by purchasers from the side of the Black Hamburgs at the same price, but with a decided preference for the *Diana*."

"One of our best new varieties is now languishing in reputation in consequence of subjection to this very evil; and the *Delaware* has suffered from it most of all. But the inherent vital energy peculiar to that variety enables it best of all to overcome the injury, when again placed in favorable circumstances, if the damage has not been so severe as utterly to destroy its constitution."

DWARF PEARS FOR SOUTHERN ILLINOIS.—I should like to be informed through the columns of the *RURAL* where the best Dwarf Pears can be obtained?—and also, the best kinds for cultivation in Southern Illinois.—YOUNG FARMER, *Elkhorn, Ill.*

REMARKS.—Dwarf Pear Trees can be obtained at all the nurseries in Rochester, and we presume of most of the principal nurserymen in all parts of the country. When in Chicago, two years since, we saw very fine Bartlett's and Beurre Diez, with which the market was well supplied. These we learned were grown in Southern Illinois and Mississippi. J. C. ALLEN, of Lena, Stephenson Co., Ill., furnishes the following list of pears, the results of his experience in that region. *Very hardy*—Flemish Beauty. *Hardy*—Bartlett, Columbia, Dix, Winter Nellis, Forelle, Fulton, Lawrence, Osband's Summer, Oswego Bourc, Onondaga, Stevens' Genesee, Sissette de Bay. *Half hardy*—Doyenne d'Ete, White Doyenne, Easter Beurre, Glout Moreau, Dilboa, Henry IV, Seckel, Tyson, Bergamotte Cadette, Aremberg. *Tender*—Bartlett, Belle Lucrative, Beurre d'Anjou, Beurre Boe, Catillac, Chautoutelle, Dearborn's Seedling, Angouleme, Louise Bonne de Jersey, Madeline, Vicar of Winkfield, Van Mons' Leon le Clerc. Growers in that section would do well to give their experience.

DEMAND FOR APPLES AT NEW YORK.—The New York Tribune says there are very few Western apples in market. The supply is mostly from the East, and the quality is generally very poor. Of course these sell at low prices. Strictly choice apples would command high figures, but there are scarcely any such in this market. Apples are keeping very badly, and on this account they are hurried into market and crowded off at whatever they will bring, notwithstanding the prospect of higher rates later in the season. A canal boat load of Western winter apples, mixed sorts, arrived last Saturday, offered at \$3 50 per barrel; \$3 was bid and refused, and the lot has gone in store. We quote choice, well packed apples:—Spitzenbergs, \$3 50; Greenings, \$3 00; Baldwins, \$3 00; Russets, \$2 25; Eastern apples, in lots, such as are now arriving, \$2 25 to \$2 75.

WISCONSIN CRANBERRY TRADE.—There are extensive Cranberry fields in Wisconsin, which yield the berries for the picking. Juneau county is famous for its Cranberry crop, and the quantity sold the present season at the town of New Lisbon alone, is 25,000 bushels, at the average price of \$1 75 per bushel. The trade has brought some \$55,000 to the town, and not less than 5,000 persons have been engaged in harvesting and preparing the berries for market. The Juneau Argus says the Cranberry crop has been a far greater benefit than the most abundant wheat harvest would have been.

THE FUCHSIAS.

MRS. STORY.

of our jewels. In a week or so we will speak of the plants that thrive best in our parlors and sitting-rooms, for with a proper selection, all may have a few flowers, that will make their rooms pleasant during the winter. At present we only design to call attention to that graceful and popular flower, the Fuchsia, which is to be found in almost endless varieties in all our Green-houses.

Of one of these varieties, the magnificent, we give an engraving. It is a splendid, large flower, rosy calyx, pretty well reflexed, showing a large, rich rosy salmon corolla. Habit, spreading and vigorous, and a free bloomer.

An English Florist by the name of STORY, has produced a class of Fuchsias with white corollas, the novelty of which has given a fresh stimulus to the culture of this elegant and graceful genus. We had thought that ingenuity was exhausted in the wonderful variety of contrast we already possessed in the colors of the sepals and corolla. Pure white sepals, and scarlet corolla we thought wonderful; then came the dark purple, nearly blue, corollas with white and scarlet and crimson sepals—in fact we had nearly every possible combination, except the white corolla, which we now have. How Mr. STORY obtained it we have not been fully advised, but we believe it was by crossing the common sorts with a species with white corolla which is now lost. We have seen only two of these varieties yet in bloom, viz., the Empress Eugenie and Mrs. STORY, and we give a drawing of the latter.—Both of these have scarlet crimson sepals and white corolla, veined with rose; the form is fine, the habit slender and they are free bloomers. Besides these, there are in cultivation—Florence Nightingale, Galanthus flore plena, double white corolla, Queen Victoria, Snow Drop, Water Nymph, &c. Of some of these we shall give engravings before long.

Now that winter has laid its icy hand upon our loved flowers, and the garden is bare and cheerless, except when enlivened with those winter friends, the Evergreens, we must look to the conservatory for the flowers with which to make winter merry. Here we may cheat the hard hearted old gentleman, and laugh to scorn all his attempts to rob us

HORTICULTURAL INQUIRIES.

EDS. RURAL:—I do not know that I have any right to bore you with a lot of queries, which may not be useful to many of your readers, to have answered in the *RURAL*; but from your general courtesy, I am induced to ask a reply to the following queries, at your convenience:

- 1st. Is there a book published giving instructions in the art of propagating plants, especially flowers, such as the *Verbena* and *Petunia*? If so, what is its cost?
- 2nd. What grape vines would you recommend for cultivation in a green-house, or hot-house,—to be cultivated by a rather ignorant—in fact a very ignorant, but moderately intelligent amateur, whose knowledge is to be exclusively derived from books, and the *RURAL*?
- 3d. How far distant from each other should such vines be planted?
- 4th. Is it really worth while to pay the extra price for the seeds sold by B. K. Bliss, and are they more reliable than ordinary seedsmen (of respectability) are in the habit of selling?
- 5th. Will some of your lady friends supply a recipe for preserving citrons in the best, or a good style?

I have just erected a small hot-house, and intend going into the art of Horticulture, for my own and my friends' amusement, and hope you will help me through a little, by replying to what you conveniently can of the above.

Need I, or any intelligent reader of the *RURAL*, say how much gratified I am by its weekly perusal? I am still ignorant, but you have no idea how much less so I am in Horticultural matters, than before I began to be your regular and thoughtful reader. Preston, C. W., 1868.

REMARKS.—1st. We hope before long to see a more complete work on the Flower Garden than we now have. Mrs. Loudon's *Ladies' Companion to the Flower Garden*, at \$1 25; *Buist's Flower Garden Directory*, and *Breck's Book of Flowers*, at \$1 each, are the best works on the subject.

2. As you have not given the dimensions of your house, we cannot tell how many vines you require. For a house that would accommodate twelve vines, we would suggest the following:—6 Black Hamburgs, 1 Grizzly Frontignan, 1 Royal Mascadine, 1 White Frontignan, 1 Zinfandel, 1 Canon Hall Muscat, 1 Sweet Water.

3d. Three feet apart is about the right distance. 4th. The question in regard to seeds we cannot answer. We have usually imported our choice flower seeds from France. But little care is taken in saving flower seeds in this country. A large portion sent out by seed stores is the merest trash. Perhaps some of our correspondents will tell us what success they have had with the seeds named.

5th. In the department devoted to *Domestic Economy*, we have recently given several recipes for preserving citrons.

THE CAULIFLOWER, AGAIN.

EDS. RURAL:—In perusing your valuable paper of the 13th inst., I noticed your acknowledgment of some cauliflowers received from me. To do justice to myself, and not have the public think I am disposed to boast in such a public manner of the proceeds of a load of cauliflowers—(though I acknowledge I enjoy bantering my competitors in agricultural pursuits, when I can produce earlier and finer crops)—I deem a few words of explanation necessary.

Having recently visited your city on business with Messrs. ELLWANGER & BARRY, in conversation with them I happened to mention that I had a very fine piece of cauliflowers, notwithstanding the unfavorable dry season, and as a small return for the gentlemanly manner I was treated, I promised on my return, to send them a few. When I sent them on, I requested in the letter to pass a couple to yourself, and to help make the letter a little interesting, I merely mentioned, in an off-hand manner, the proceeds of the last cutting I had taken to the city,—not expecting one solitary load of cauliflowers to gain such notoriety. Now, Mr. MOORE, since you have chosen to expatiate so freely on said load, I shall have to send you the proceeds of "tother" last load on the 16th inst. You see our New Yorkers are bound to have good cauliflowers for Thanksgiving dinner:

4½ dozen extra at \$3 00	\$ 13 50
3½ dozen prime at \$3 50	12 25
15 dozen steady at \$1 75	26 25
	\$151 12

Cullings stepped out, or shored among 3ds.

Now, Mr. Editor, I want to inquire whether Prof. CUTTING's cauliflowers were a few pet plants in his garden or whether he had several thousand of them. [Only a few "pets" in the professor's garden.—Ed.]

I very much regret I did not send a specimen out of later cuttings, as I could have sent much larger. I shall merely add the rows were five feet apart, and the leaves covered the space between the rows on the entire piece. R. H. BENNETT.

Fort Hamilton, Nov. 18, 1868.

ILLINOIS HORTICULTURAL SOCIETY.—A meeting of this Society will be held at Bloomington on the 14th, 15th, 16th and 17th of December next, for the election of officers, and the discussion of Horticultural subjects. We hope the Secretary will send us a brief report of this meeting.

DOWNING'S FRUIT BOOK.—Can the new and revised edition of "Downing's Fruit and Fruit Trees of America," be sent by mail, and if so, what is the price, postage pre-paid?—J. L. L., Clark, Pa.

REMARKS.—Downing's *Fruit Book*, Revised Edition, can be sent to you, by mail, pre-paid, for \$1 75.

Don't forget to take precautions to secure your trees from mice. An hour's labor may save many years of regret.

PACKING TREES FOR CALIFORNIA.

WISHING to send some choice fruit trees to California, by express, this fall, how can I do it? Must I pack in a tight box with damp moss or otherwise? Please answer this through the *RURAL* and oblige.—D. B. WAITE, *Springwater, N. Y.*, Nov., 1868.

REMARKS.—The great error in packing trees for California has been, we suppose, in placing them in the boxes too moist. If the roots and branches are packed in wet moss, as soon as the trees feel the effects of the warm climate to which they must be subjected in their passage, the mass begins to heat, a forced growth is made, to the great injury, if not the destruction, of the whole. Some have packed in charcoal dust, and we believe with good results. The charcoal is a non-conductor of heat, therefore its use. One of our subscribers in Sacramento, who has obtained thousands of trees and plants from the nurseries here, and who, since he has ordered them packed according to his present plan, has not lost one per cent, though previously the loss was as much as ninety, sends us his method, as follows:—"In the first place the box was made of rough inch boards. The two end pieces each two inches longer than the width of the sides.—The side pieces are then nailed (with 10's or 12's) to the edges of the ends, so that when the box is upon its bottom, the ends are perpendicular, projecting one inch above and below, then the boards for the bottom and top are cut so as to go across the box and nail upon the edges of the side pieces, while the projections of the end pieces are nailed to the edges of those cross-boards. I am thus minute in describing the box, because they are seldom made thus, but when they are, all hoop and binding is dispensed with. Across the bottom, and up and down the sides and ends of the box, on the inside, strips of inch board, one inch wide and six inches apart, are tacked. Then take moss, entirely green, directly from the swamp, and in as fresh a state as possible, fill the spaces, between the strips on the bottom, tight and cover over to the thickness of one inch, then lay in a layer of trees or plants, keeping the spaces at the sides and ends filled tight with the moss. Then cover the layer of plants with a layer of moss, and then another layer of plants, and so on, till the box is full to within one inch. Having tacked the strips upon the under side of the cover, and crammed the spaces with moss, fill up the box to the top, calculating that the inch strips will obtain room by pressure, put on the cover, and nail, as the bottom."

This plan, we would suppose, might give too much moisture, but will not urge an opinion against the successful practice of our friend. Perhaps some who are engaged in sending trees to California will tell us in what way they are most successful.

PLANTING TREES IN CLAY SOIL.—I am about planting an orchard, on a very strong, stiff clay.—How would you advise me to prepare the ground?—R. F., *Cayuga, Haldimand Co., C. W.*

REMARKS.—Such soils are generally retentive of moisture, and unless well drained, the trees will be sickly and the bark mossy. Deeply and thoroughly drain at once. It will be too late to plow this fall, so break it up in the spring, but not until it is tolerably dry. Such soils are much injured by working too wet. Plow deep, so as to break up the subsoil, no matter about the labor. A dozen trees in a well prepared soil is better than a hundred in a stiff, soggy clay, unbroken and undrained. Harrow and cultivate so as to get a good tilth, then plant the trees, obtaining some mellow soil or leaf-mould from the woods to place around the roots.—Prune up the branches pretty close and cover the ground around the tree with coarse manure. If you must crop the ground grow potatoes, or some root crop, as carrots or parsnips. We have seen a great many thousands of trees in Canada destroyed by being planted in just such a soil as is described by our correspondent.

LARGE VEGETABLES.—J. M. LATTIN, of Hyde Park, Dutchess county, New York, writes as follows to the *RURAL NEW-YORKER*:

"Occasionally there appears in different papers, accounts of large vegetables, &c. Will you please give notice through the *RURAL* of the following, which we think very large. Mr. Daniel Lattin grew in his garden two blood beets which were perfect; one measured 24 inches in length, 23 inches in circumference, and weighed 12½ pounds, and the other was 20 inches in circumference and weighed 6 pounds."

The above beets may be considered large in Rochester and in Dutchess county, but here in Wood county they would be considered rather small specimens—certainly they would not be deemed worthy of any special, or public, notice. John Powers, Post-Master of this place, has three beets, of the blood-red variety, the largest of which weighs 17½ and the smallest 12½ lbs. Try it again, gentlemen, but don't brag about beets that only weigh 12½ lbs.—*Journal, Perrysburg, Ohio.*

CANKER WORM.—Can you inform me of any better mode of preventing the ravages of the Canker Worm than the mixture of coal and common tar, recommended on page 65 of "Downing's Fruit and Fruit Trees of America," Revised Edition? I have applied it to two rows of apple-trees, but if enough is put on to do any good, some of it runs down upon the bush below the bandage. "But this," Downing says, "has a very injurious effect upon the trunk." It dries so soon, too, in this climate, that renewing it as often as necessary, will be very tedious. Can you inform me where "Dennis' Patent Circular Lead Trough" can be procured, and at what price?—FRUIT GROWER, *Burlington, Iowa*, 1868.

REMARKS.—You can make a composition that will not readily dry. Try the melted India-rubber. The little tar or composition that may chance to run down the trunk will do but little harm. All should be cleaned off by the last of May. We cannot answer the question in regard to the leaden trough.

GRAPE AND VINE GROWING ON KELLEY'S ISLAND, OHIO.—The Sandusky Mirror is informed by a gentleman who has spent some time on Kelley's Island, near Sandusky City, that Mr. LOUIS HARMES has, from an acre of land—by actual measurement—realized \$1,225, above all expense, from his sales of grapes, grape roots and wines, the past year.

Domestic Economy.

COLORING RECIPES, MEAL DUMPLINGS, &c.

TO DYE A LIGHT BLUE.—In answer to the inquiry, how to color light blue on silk, I give a method which I have tried with good success on ribbons. To a sufficient quantity of warm water, add a little indigo compound, thoroughly wet the goods in it, air, and rinse in cold water. If not dark enough, add a little more compound. The goods should be wet before putting in the dye, to prevent spotting. Soft water is best for coloring purposes. A little gum-arabic, prepared as for starch, added to the rinsing water will give it a look of newness.

APPLE DUMPLING.—Use buttermilk and sour cream as for biscuits, with a small quantity of butter or rice lard; salt, of course, and enough saleratus to correct acidity. Knead, roll to a little less than half an inch in thickness, do up into any size preferred, with sliced apples in the centre. Bake, boil, or steam, until the fruit is cooked tender. Serve with sweetened cream, or butter and sugar, if cream cannot be had. This, if rightly prepared, will make a dish at which SYLVANUS will tarry until he forgets to "walk down with cap in hand."

MEAL DUMPLINGS.—Take a quantity of meal, according to the number to be served, a little salt, scald with boiling water, allow to cool a little, then stir in enough flour to make it ball nicely, with floured hands. Drop into boiling water, and boil one-half hour. Nice with baked fresh meat gravies.

CORN BREAD.—Take four quarts of sweet milk; one pint of yeast or emptyings; one pint of rye or wheat flour, (the former is preferable to the latter,) and meal, stir a little thicker than for griddle cakes. Put into a quick oven, allow it to gradually cool, bake slowly three or four hours and remain in the oven over night. Corn bread cannot be baked too long. Another fault is in grinding the meal too fine—it should have a roundness like fine sand. RURAL READER.

Oswego Co., N. Y., 1868.

TO FASTEN ON THE HANDLES OF KNIVES AND FORKS.—The handles of knives and forks that have come off by being put in hot water, may be fastened in the following manner:—Procure some powdered resin, and mix with it a small quantity of chalk, whiting, or quick lime, let the handles be about half-filled with this mixture, heat the ends of the knives or forks, and force them in; when cold they will be found to be securely fastened. N. B.—Knives and forks that are not fastened to the handles by rivets should never be put into hot water.

Or,—Take a small portion of a quill pen, and put into the handle of the knife, warm the blade, and when it is hot put it into the quill in the handle, and press it in firmly; this is a very simple method, but it has been found to answer the purpose required several times.

Or,—Brick-dust stirred into melted resin makes a composition that will fix knives and forks in their handles. The tang should be thrust in warm.

Or,—Mix a little chopped hair or tow—with powdered resin, and fill with it the hole in the handle of the knife, then heat the spike of the blade, (i. e. the part which fits into the handle,) and ram it down into its place; the heated steel will melt the resin, which will then keep the blade of the knife or fork in its place. N. B.—The chopped hair (or tow) must not be omitted.—*London Field.*

CRINO HAMS.—As the time is at hand for preparing these useful stores of rich and savory food, a few words will not be out of place in regard to them. The legs of hogs, short in the back, are the best for hams, and should be chosen in preference to lanky hogs. They may be salted by immersion in a clean pickle, containing a little sugar and saltpetre dissolved, or they may be salted by rubbing ground solar evaporated salt over them, turning them every day, and giving them a good rubbing. A little sugar and ground black pepper added to the salt will much improve the flavor of the meat. It requires about a month to salt hams by the wet process, and three weeks by the dry system. At the end of this period, they should be hung up for a few days to drip, and then they are ready for smoking. Much depends on the kind of material used for smoking them, so as to secure a sweet flavor. Whatever fuel is used for this purpose, one condition should never be overlooked: it should be perfectly dry, or else it will be liable to impart a bitter taste to the meat. Dry corn cobs, and some dry, sweet hay are superior to all other agents that we have seen employed for smoking beef and hams. Mutton hams may be prepared in the same manner as those of pork, and they are exceedingly palatable when the meat is good, and care exercised to smoke them slowly.—*Scientific American.*

ECONOMICAL CAKE.—Take dry cake, rub fine; add 1 egg; 1 cup of molasses; sweet milk enough to moisten; stone and chop some raisins; add half a teaspoonful of saleratus; flour enough to make as thick as pound cake; beat well and bake, and you will have a palatable cake.

SQUASH PIE.—Take mealy squash, stew, drain off the water, strain, add sugar, ginger, salt, and the extract of lemon—bake the same as tart pie.—*ELIZA, New Hampshire*, 1868.

PURE AIR.—The *Eclectic Medical Journal* of Philadelphia, in speaking on this subject, very properly remarks that it is not only necessary that men may have sufficient air to breathe, but it is necessary to provide air for the apartment itself in which they live, as well as for the persons who inhabit it. The influence of impure air is not only exercised upon persons through their breathing organs, but the surface of their bodies, their clothes, the walls of the apartment—in short, the free surfaces of everything in contact with the air of the place becomes more and more impure—a harbor of foulness, a means of impregnating every cubic foot of air with poison—unless the whole department has its atmospheric contents continuously changed, so that everything animate and inanimate is freshened by a constant supply of pure air.

Ladies' Port-Folio.

COTTAGE SONG.

BY JOHN S. ADAMS.

We've a cottage clothed with roses,
Near a wood
Where the singing birds of summer
Nest and brood;
There in early spring the daisies
Gem the sod,
Looking up to heaven above them,
And to God.

There in holy calm we worship
One above,
Through his works that all around us
Speak his love;
Read we there his will in every
Rock and tree,
While his blessings fall upon us
Rich and free.

Beautiful the morning sunlight
Cometh there,
Crowning Nature at her early
Morning prayer;
And at evening, when the twilight
Closeth round,
Still, devoutly at her worship,
Is she found.

We are not alone, for angels
Come and go,
Walking often through our cottage
To and fro;
Promising to guide and guard us
With their love,
Till we go to live among them,
Up above.

Simple life is ours, we follow
Nature's way,
Learning of her truthful lesson
Day by day;
Striving to fulfill our mission,
Doing good;
Living happy in our cottage
Near the wood.

Written for Moore's Rural New-Yorker

"HOME, SWEET HOME."

If there is a spot on the face of this wide world to which we turn with heart-longings and yearnings of spirit when mingling with the stranger-hearts of earth, that spot is Home. What soul, however calloused by sin—that destroyer whose breath is like a poisoned arrow, to leave death and desolation in the midst of our dearest affections,—however its wealth of love may have diminished by long absence or rough dealing with the world, what heart, we say, over which does not often come dear thoughts of "Home, Sweet Home!"

The wanderer, the alien from his father's house, with not a friend upon whom to lean with trust and confidence in those hours which even the stoutest heart has known, when the soul, distrustful of its own strength and yearning to nestle in the arms of affection, instinctively turns to a tried and faithful friend for shelter and protection; amid the weakness of that moment does he not then long for the retreat that home affords? How saddening when mingled with these is the thought that even home is no home for such an one to hear him say:—"I have not a friend in the wide, wide world, and at home—they do not want me there." The great of earth, whose brows are wreathed with fame, and whom honors await on every hand—oh, how vain, how empty those glittering baubles, without the calmer, more quiet joys—the sweets of home. Who would exchange the affection he possesses in the hearts of those who love him there for all the greatness and vain praises of the world?

The student, striving with loneliness and often discouragement in view of the greatness of the task before him, how often, in the midst of busy study does the thought of home and the dear ones there come over the mind with an overwhelming force. Perchance, as we muse in retirement at the twilight hour, we think of a home circle, upon which, if we could but look, it would be the greatest blessing our lonely hearts would wish.

But why is home so dear? Why does it throw around us a potent spell, more lasting than that of the charmer, and whose pleasures are greater than aught else this beautiful earth affords?—We are bound to it by little cords of love, and these are not brittle threads, but twine their delicate fibres around and around us again, until they are stronger than flaxen bands or iron chains. Man is a social being, and affection is one of the noblest attributes of his nature. Nowhere is it so opportunely exercised as at home. Others may engage our love for a time, but these too often prove false and turn coldly from us; while in the home circle are long-tried friends, and we may trust them, for they love us—a reason in itself sufficient to prove a safeguard for every ill, for every emergency in life. If we are sick, where shall we go but to our home? What hands can tend us so gently as those we love? Are we in sorrow—who can sympathize with us so fully? And who but they will overlook our faults and bear with our imperfections? Around that spot cluster all the recollections of by-gone days, beautiful flowers in the garland of memory.

In helpless infancy, home is the cradle of protection for the tiny visitor to the stranger-land of earth. In wayward youth, it is the safeguard from the tempter's power—the haven of rest for the enthusiastic soul. In manhood, when mingling with the world in busy duty, it is a retreat for the tired and weary mind; and, basking in the memory of other days, it gains strength for future scenes of life. In old age, it lives in memory, although long ago it may have ceased to live in reality. If our earthly homes are so dear, how much dearer will be our Father's home, the home of eternal rest in heaven, when, weary with the toils of earth, our work accomplished, we shall go where partings are no more.

P. Fair, N. Y., 1868

How easily one can tell whether a man is glad from within; or whether it is only the play of the sunbeams that chance to fall upon him. Happiness is not the work of a chisel and mallet; not mortised into the soul, it is "put out" like the arm of a tree, whose green, untraveled sleeve flutters with the life it shares.—Taylor.

VINDICATION OF HOOPS.

AMELIA does not wear hoops! Is it possible? How delightfully disappointed "TRUTH SEEKER" must have been to find one woman so sensible as to respond to his sentiments! As for us, we went straightway into wonder-land to ascertain if it was any AMELIA that we ever knew. But we are confident they all wear hoops. We wear them, too, and wear them not only because they are more convenient to walk in, and more comfortable, especially in warm weather, but because they are fashionable, and we would not set ourselves up for a model for the world to imitate. We fear that "TRUTH-SEEKER" overbites a vain hope, namely, that these butterflies are in the last stage of their existence, for "variety is the spice of life," in dress as everything else, and very soon something new will be introduced, equally absurd, to shock the taste of over-sensitive people.

But we do not consider ourselves, or all others, who choose to uphold fashion, as mere butterflies, devoid of sense or intelligence, for we have seen a few really sensible women who tolerate the ridiculous fashion. As for the Anti-Hoopologists who would find spirits congenial, come to Egypt and tarry awhile on the banks of the Wabash, and here, at least, we will vouchsafe that your sense of propriety will not be shocked by the sight of people who are "greater than God made them." Prairie Home, Ill., 1868. A. B. C.

A WOMAN'S INFLUENCE.

JUDGE O'NEAL, in the Yorkville Enquirer, tells the following of Judge William Smith, of South Carolina:

"He had the rare blessing to win the love of one of the purest, mildest, and best of women, whose character has ever been present to the writer. He married Margaret Duff. In the worst days she never upbraided him by word, look, or gesture, but always met him as if he was one of the kindest and best of husbands. This course on her part humbled him and made him weep like a child. This sentence, it is hoped, will be remembered, was the language of Judge Smith to the friend already named; and to those who know the stern unbending public character of the character of the Judge, it will teach a lesson of how much a patient woman's love can accomplish. He was at last reformed by an instance of her patient love and devotion, as he himself told it:

"The evening before the Return Day of the Court of Common Pleas for York district a client called with fifty notes to be put in suit. Mr. Smith was not in his office—he was on what is now fashionably called a spree, then a frolic. Mrs. Smith received the notes and sat down in the office to the work of issuing the writs and processes. She spent the night at work—Mr. Smith in riotous living. At daylight, on his way home from his carousals, he saw a light in his office, and stepped in, and to his great surprise saw his amiable wife, who had just completed what ought to have been his work, with her head on the table and asleep. His entry awoke her. She told him what she had done, and showed him her night's work—fifty writs and processes! This bowed the strong man; he fell on his knees, implored her pardon, and then and there faithfully promised her never to drink another drop while he lived. 'This promise,' says my friend, Col. Williams, 'he faithfully kept,' and said the Judge to him, 'from that day everything which I touched turned to gold.' 'His entire success in life,' says Col. Williams, 'he set down to his faithful observance of this noble promise.'"

No better eulogy could be pronounced on Mrs. Smith than has just been given in the words of her distinguished husband. The reformation of such a man as William Smith is a chapter of glory which few women have been permitted to wear. To the people of South Carolina, and especially of York district, certainly no stronger argument in favor of temperance, total abstinence, need be given.

ADVICE TO LADIES.

HAVE the feet well protected, then pay the next attention to the chest. The chest is the repository of the vital organs. There abide the heart and lungs. It is from the impression made upon these organs, through the skin, that the shiver comes. It is nature's quake—the alarm bell at the onset of danger. A woman never shivers from the effect of cold upon her limbs, or hands, or head; but let the cold strike through her clothing on her chest, and off goes her teeth into a chatter, and the whole organism is in a commotion. One sudden and severe impression of cold upon the chest has slain ten of thousands. Therefore, while the feet are well looked after, never forget the chest. These points attended to, the natural connection of the dress will supply the rest, and the woman is ready for the air. Now let her visit her neighbors, go shopping, call upon the poor, and walk for the good of it, or the fun of it.

Keep away from the stove or register. Air that is dry or burnt, more or less charged with gases evolved by the fuel, is poison. Go up stairs and make the beds with mittens on. Fly around the house like mad, and ventilate the rooms. Don't sit pent up in a single room with double windows. Fruit will not retain its full form and flavor in air-tight cans; neither will women. They need air. If the shiver comes on during these operations, go directly and put on something more about the chest.

Again, do not live in dark rooms. Light fades the carpet, but it feeds the flower. No living animal or vegetable can enjoy health in darkness. Light is also necessary as air, and a brown tan is far preferable, even as a matter of beauty, to a sickly paleness of complexion.—Selected.

SYMPATHY is much more catching than intelligence. Anybody can feel, but every body cannot understand. Hence pity for a person brought into distress by his own acts, often outweighs all the conviction produced by a knowledge of his crimes.

It is said that the ivy will not cling to a poisonous tree or substance. What a pity that the tendril of a woman's heart have not the same salutary instinct.

Choice Miscellany.

CHILDHOOD.

INSCRIBED TO A LOVED BROTHER.

BY HENRON DELL.

At rosy twilight's hour
I love to wander back
My wayward, devious track,
And feel the gentle power
Of pure parental love,
Falling like dew upon each flower
That bloomed beside our garden bower
When skies were bright above
And all was deep, unchanging love.

How fresh each scene revives,
As though but yesterday,
Like children grouped in play,
And pleasant were our lives,
For innocence is bliss,
Which age and knowledge oft deprives
When manhood's busy state arrives—
For then a mother's kiss
Was in itself a world of bliss.

Sweet hours of childhood gleam!
Ah, well do I remember
How we would hail December
With naked field and tree,
And long for winter's shroud;
Each changing, clouded sky we
Watched with deep anxiety—
Then shout and laugh aloud
When snow came for the old year's shroud.

And when the hours of night
Locked up the gates of day,
And shed a silvery ray
From heaven's starry height
Too beautiful for words;
Beside the hearthstone's cheerful light
Labor and care took rapid flight,
And sweeter than the birds'
First spring-song, fell our parents' words

'Tis sweet at evening's hour
In solitude to ponder,
And, as in childhood, wander
And pluck a withered flower
From memory's sacred urn,
And tread in youth's enchanted bower,
Where pleasures shed their genial power
To meet us at each turn—
The sweetest gems in memory's urn.

Prairie Cottage, Ill., 1868.

LINGERINGS WITH NATURE.—No. III.

THE HUDSON RIVER.

BEAUTIFUL as a dream! Varied as the crowding memories of a blissful hour! Calm and rippling as the tide of pleasant thoughts and glad emotions! Bright as the glittering dew-drop upon the morning flower—a clear, dark eye in the glowing face of peerless Nature. Who can revel in its ever fresh beauty and not be inspired with holler thoughts and impelled to loftier action? It is no marvel that the villas of poets and artists throng its banks, and that their labors betray the almost upon which they feed. Where else could thought be so clear and strong, action so easy and rapid, and fancy so swift-winged? Where else such a grouping of rock and river, of cliff and bay, of highland and valley, and such a suggesting of beauty and strength, rapture and power, joy and worship? What wonder that it should have been the burden of song and the theme of many a story? Could I have elsewhere have found subjects for his fanciful legends and weird tales, quaint and old? Where else could WILLIS and MORRIS have caught their flowing numbers and gentle measures, save from the lines of grace and forms of beauty ever visible from their own doorsteps? Where better could the artist, who lingers in their sweet vine-clad homes, study Nature in her diviner forms? Even the stolid eye of the unobserving traveler lights, as each new winding of the river reveals beautiful vistas, changing and picturesque as the visions of an enchanting day-dream.

From the broad Tappan Zee to the wide stream flowing placidly between the lowland banks near Albany, the heart is warmed, the imagination kindled and the soul fired through Nature's melting and elevating influence. The Palisades, the frowning rocks, the distant mountain, the bold hills and the gentle slopes, suggest the grand cascade beyond, towering from a lofty height, surrounded by the smooth lawn and skirted by the beautiful stream. Pleasant vagaries of thought come and go with the flitting shadows, and linger about the tiny white-sailed vessels as they gleam in the dewy morning. A dawning of new mental vision, a dispersing of inward fogs and mists—a glimpse beyond the regions of doubt and evils of fear—a blissful grasping of thought before sealed, come with each changing feature of the far-famed Hudson.

Let those who are weary of the world,—those who are chafed and scourged by disaster and disappointment,—maddened by false hopes and embittered by unexpected perils, find the healing balm which Nature and Art here offer,—let them drink freely of this holy inspiration and their struggles with destiny are over, their wounds are healed.

West Point!—almost the creature of an enchanter's wand, yet a Military School!—a drill, amid scenes only befitting glorious dreams and their vivid realization! No suggestions of bloody warfare or frightful massacre linger in the shadowy nooks or upon the island—gems which bedeck the shining water. No memories of desperate midnight attack or silent retreat haunt the bold front of Stony Point, or cling to the broad level of White Plains. No muffled oars gently stir the calm water, and no sharp report rings over the grove-dotted banks.

Sweet and soothing, inspiring and nervening, rousing and strengthening, no newer scenes or more earnest pursuits can banish its memory or annul its growing influence. A day upon the Hudson is embalmed, engrained in the soul. There is a phase of nature for each mood of mind, and no stagnation is so hopeless, no stupidity so lifeless that it may not be moved by such a mingling of beauty and variety, grandeur and sublimity.

North Fairfield, O., 1868.

LESSONS OF THE SEASON.

THERE is an "eventide" in the year—a season, as we now witness, when the sun withdraws his propitious light, when the winds arise and the leaves fall, and nature around us seems to sink into decay. It is said, in general, to be the season of melancholy; and if by this word be meant that it is the time of solemn and of serious thought, it is undoubtedly the season of melancholy; yet it is a melancholy so soothing, so gentle in its approach, and so prophetic in its influence, that they who have known it feel, instinctively, that it is the doing of God, and that the heart of man is not thus finely touched but to fine issues.

When we go out into the fields in the evening of the year, a different voice approaches us. We regard, even in spite of ourselves, the still but steady advance of time. A few days ago, and the summer of the year was grateful, and every element was filled with life, and the sun of Heaven seemed to glory in his ascendant. He is now enfeebled in his power; the desert no more "blossoms like the rose;" the song of joy is no more heard among the branches; and the earth is strewn with that foliage which once bespoke the magnificence of summer. Whatever may be the passions which society have awakened, we pause amid this apparent desolation of nature. We sit down in the lodge "of the wayfarer man in the wilderness," and we feel that all we witness is the emblem of our own fate. Such also in a few years will be our own condition. The blossoms of our spring, the pride of our summer, will also fade into decay; and the pulse which now beats high with virtuous or with vicious desire, will gradually sink, and then must stop forever. We rise from our meditations with hearts softened and subdued, and we return into life as into a shadowy scene, where we have "disquieted ourselves in vain."

Yet a few years, we think, and all that now bleeds, or all that now convulses humanity, will also have perished. The mightiest pageantry of life will pass—the loudest notes of triumph or of conquest will be silent in the grave; the wicked, wherever active, "will cease from troubling," and the weary, wherever suffering, "will be at rest." Under an impression so profound we feel our own hearts better. The cares, the animosities, the hatreds which society may have engendered, sink unperceived from our bosoms. In the general desolation of nature we feel the littleness of our own passions—we look forward to that kindred evening which time must bring to all—we anticipate the graves of those we hate, as of those we love. Every unkind passion falls with the leaves that fall around us; and we return to our homes and to the society which surrounds us, with the wish only to enlighten or to bless them.

If there were no other effects, my brethren, of such appearances of nature upon our minds, they would still be valuable—they would teach us humility, and with it they would teach us charity.

—Rev. Archibald Alison.

NOVEMBER.

GEORGE D. PRENTICE, Esq., of the Louisville Journal, gives a spirited and exquisite picture of November:

"Room for the athlete! room for the broad-shouldered, deep-chested vigorous November, who leaps with an elastic bound into the arena! He has divested himself of all superfluous clothing; every limb is bare, and his brawny trunk stands in glorious majesty, while his head, encircled by a coronet of the purple vine and scarlet berries, proclaims him the King of the Autumn! Doomed as he is, deserted by his fleeting brethren, pressed by the advancing legions of gloomy Winter, he still looks 'every inch a king!' He has gathered about him his vassals, who neither tremble with fear nor look pale at the portents around them, but every one has thrown down his leafy gauntlet and bent his branchy lance to await the coming storm!"

He then describes November sinking to repose "to the mellow cadence of the Indian Summer, amid the blazonry of the golden maple, the gorgeous crimson of the forest, and the bright scarlet of the running vine which girt his sturdy guard of oaks," and concludes thus:

"Who then can assent to the poet's idea that with November, 'the melancholy days have come, the saddest of the year?' Not we! There is no sadness in any work of God's providence; he orders all things in kindness, and his smile can warm this last autumnal month and make it gorgeous in the sunshine which fills the human soul with gratitude, and illuminates it with the full, bright and beatific knowledge of his Eternal Love."

COURAGE.

WE should brave trouble as the New England boy braves winter. The school is a mile away over the hill, yet he lingers not by the fire, but with his books slung over his shoulder, and his cap tied closely under his chin, he sets forth to face the storm. And when he reaches the topmost ridge, where the powdered snow lies in drifts, and the north wind comes keen and biting, does he shrink and cower down beneath the fences, or run into the nearest house to warm himself? No; he buttons up his coat and rejoices to defy the blast, and tears the snow wreaths with his foot, and so, erect and fearless, with strong heart and ruddy cheek, he goes on to his place at school.

Now, when the fierce winds of adversity blow over you, and your life's summer lies buried beneath frost and snow, do not linger inactive, or slink cowardly down by the way, or turn aside from your course for momentary warmth and shelter, but, with stout heart and firm step, go forward in God's strength to vanquish trouble, and to bid defiance to disaster. If there is ever a time to be ambitious it is not when ambition is easy, but when it is hard. Fight in darkness; fight when you are down; die hard, and you won't die at all. That gelatinous man, whose bones are not even muscles, and whose muscles are pulp, that man is a coward.

—Henry Ward Beecher.

GREATNESS—A great, a good, and a right mind is a kind of divinity lodged in flesh, and may be the blessing of a slave as well as of a prince; it came from heaven, and to heaven it must return;—and it is a kind of heavenly felicity, which a pure and virtuous mind enjoys in some degree, even upon earth.—Seneca.

Sabbath Musings.

FEARING TO GO.

BY EDWARD KNOWLES.

Am I distressed with nameless fears,
And half-believing day by day,
When I should wipe away these tears,
And see God smiling on the way?

Where are the promises to me
Of grace and strength to help in need;
And all the time I fail to see
These promises are rich indeed.

God! I prone to doubt and wander so,
My duty here half-understood,
I must confess I do not know
What really is for my good.

Take me in thine extended arms,
And fold me to thy loving breast,
Until the time when false alarms
Shall not disturb this peaceful rest.

Wilson, N. Y., 1868.

Written for Moore's Rural New-Yorker

THE GOOD WE MIGHT DO.

FELLOW PILGRIMS, did you ever think of the amount of good you might do in your journey through this transitory world? Did you ever reflect upon the purpose for which existence is given? Has the serious question of what it is to live, and move, and have your being, ever been the theme of deep, continued meditation during the few short years spent upon the earth? Or, has year after year rolled by, in time's unconscious flight, without your asking, "from whence did I come? whither am I tending? where am I going?" It may be that your calling has occupied all your hours save those which nature demands for repose. Peradventure the exigencies of worldly affairs have kept all your powers engaged in their service, and, even when the mind would revert to the problem of life,—the mysteries connected with mundane existence,—you turned a deaf ear to the warnings of conscience, and paused not a moment to hear its kind pleadings in your behalf.

Man is a rational, intelligent being, and in order to know and acknowledge his duty and responsibility, he must pause and meditate. Bear with us, reader, while we offer some suggestions concerning our mission here. Let us take for our starting point the simple inquiry found in the shorter Catechism, so plain that the mere child can comprehend it:—For what purpose was man created? *Ans.*—To glorify God and enjoy him forever. This definite reply gives us the key by which we may unlock the door of wisdom, and get access to the richest stores of knowledge. Now, if we would know how to glorify Him, let us read His Word.—No better portion of the Sacred Volume could be found as a guide for adoption in life, than one of the Ten Commandments, which says, "thou shalt love the Lord thy God with all thy heart, with all thy strength, and all thy mind, and thy neighbor as thyself." Once let the race fully comprehend the import of this command, and act upon it—the Millennium would soon dawn upon us. But, as this is addressed to each individual of the human family, it is strictly applicable to you,—your part in this great work of regaining what was lost by the fall is clearly pointed out. If you obey the first request in the passage quoted, viz.,—"Love the Lord thy God,"—you will keep His commandments. One of these is found in the last clause,—"Love thy neighbor as thyself." A neighbor may be either friend or foe.

The good that you might do is now evident. If you feel a deep, abiding interest in the welfare of those around you, and know in your own soul that many are leading a life entirely opposite to that standard by which we judge the friends and enemies of God, can you see them journeying on in that road which leads to destruction, without ever warning them of the imminent danger which attends their wayward course. Probably there are those in your own family,—living under the same roof that shelters your head,—and it may be, some allied to you by the strongest ties of affection, who are verging upon the very brink that separates them from eternity, and to whom you not even broach the subject of religion. Perhaps seasons occur when they feel a strong inclination to consider this matter,—when conscience rebukes them for past acts, and the soft pillow affords no rest,—and their proud hearts forbid their telling of the strivings of the Spirit. What a relief it would be if some friend would only come to their aid and direct, advise, and comfort—pointing them to the "Lamb of God that taketh away the sins of the world!"

Think not that religion, however grave the aspect may appear to others, is always unpleasant to you. Think not that your efforts to do all the good you can will be unfeared and treated with contempt,—that your best endeavors will fall to be appreciated or to ultimately benefit the world.—"The good we do here lives after us." As instruments in the hands of an Omnipotent Ruler, we may be the means of rescuing many wanderers from the ruinous course they now thoughtlessly pursue. We are told to "convert sinners from the error of their ways, and save souls from death." Who does not long for the day when every professing Christian will be active, zealous agents of God, "going about doing good," reasoning with their fellows, telling them of the "Savior they have found"—delineating the plan of salvation, and the riches of mercy. It is time for that day,—it should be now. "Procrastination is the thief of time;" and if many who spend a good portion of this short pilgrimage in waiting for something to "turn up," would go earnestly to work, with concert and unity of action, the blessings of Heaven would smile upon them, and earth rejoice at the good they would do.

D. B. H.

McDonough, Del., 1868.

He that is good, will infallibly become better, and he that is bad, will as certainly become worse; for vice, virtue and time are three things that never stand still.—Colton.

When one sin is admitted, it is generally found that it has a companion waiting at the door, and the former will work hard to gain admission for the latter.

The Traveler.

Written for Moore's Rural New-Yorker

Sketches from the Alps to the Adriatic.

NUMBER EIGHT.

Approach to Venice—First Impressions—Square of St. Mark—Night Scene—Music—The Match-boy—The Fruit-Seller—The Shipper—Vender—Glassware—The Sailor—The Cigar-man—The Music-girl—Morning—Flower-girl—Sunday Scene.

The cars bore me away from Verona towards the Adriatic, and sped over the monotonous level plain, where grain and grass were waving between rows of mulberry and fruit trees, from which hung festoons of grape vines. The marshes of Arcole, where, in three days of desperate battle, Napoleon once destroyed an Austrian army—were passed, we went through the cities of Vicenza and Padua, and yet ran on over the level plains. Now and then a few tall Lombardy poplars rose upon the right or left, shot by, and sunk backward in the distance, and we passed low country houses, half hidden among foliage. The soil began to grow less fertile, and seemed full of water. I leaned out of the window and gazed forward to the edge of the horizon, where lay piles of picturesque thunder clouds, and wondered where the train would go, for, at a short distance, neither plain nor sea was visible. Suddenly I saw domes and towers, and tall masts with waving flags, rising like a vision between me and the clouds; their rich palaces and churches, sitting on the water, and hulls of ships, and innumerable gondolas, all floating, as it were, on the surface of the Lagoon. It was Venice.

I had approached the fairy city of the earth—a city which once boasted to be mistress of the sea, and sent her ships over the blue waves of the Adriatic and the Mediterranean to the shores of the Turk and the Arab, to the Isles of Greece and the Holy Land—a city, founded on piles and stone, sunk in the mud of seventy-two small islands, where there are smooth canals and silent gondolas, instead of stony streets and noisy carriages.

The traveler formerly approached Venice in a gondola, but, at present, the Lagoon is traversed by a stone bridge, two miles and a quarter long, and supported on two hundred and twenty-two arches. The cars pause in the small station, and you descend, not to a street, but to a canal, and enter a gondola. It is rowed to your hotel, and you ascend from the boat by stone steps, that are constantly wet by the salt sea. You are struck with the stillness of the city. There is no noise but the hum of the voices of men, for in all Venice there is not one carriage.

At first you are disappointed with Venice. As you float along the Grand Canal in a gondola, you look in vain for those gorgeous marble palaces, which, you imagined, rose up along the great highway of the City of the Sea. You can scarcely believe the gondolier, when he points out buildings with which you are familiar by description, and which you had imagined were impressive as any in Europe. They are so small and so dilapidated, standing close to the water's edge, with the salt sea washing their foundation stones, and seaweed clinging to their steps and walls, that it seems in the lapse of a little more time they will tumble to final ruin and be swallowed by the waters. Yet when you look closer you see traces of former splendor, when they were the dwellings of merchant princes, who drew their wealth from the East, and boasted that their city was Mistress of the Sea. Groups of marble, windows that are miracles of Art in proportion and design, enriched by the most elaborate and thoughtful carving, are set in crumbling brick walls, from which the precious marbles of the East, or frescoes designed by great masters, in which they were once encased, have fallen by slow decay, or been torn away by the unsparring hand of a conqueror. In these same walls modern windows, or rather square holes have been made, breaking all unity of design, and making the Art look as if it had been plundered from some demolished edifice, and set as a gem in a meaner building. Often in front of these windows are marble balconies, having railings of white marble, exquisitely carved and shaped, with figures of fat, good-natured looking puppies sitting on the corners—a fantastic ornament, truly. These windows and balconies—which are unequalled by the finest Fifth Avenue house in New York—are scattered all over Venice, often being placed in buildings, which, whatever they might have been formerly, from decay and alteration, have now no other claims to architectural beauty. Most of the buildings, indeed, have had their frescoes obliterated by repainting, and the old and magnificent Venetian red is fast becoming daubed over with modern whitewash.

The chief point of interest in Venice is the Square of St. Mark, in the vicinity of which are the finest specimens of architecture, as the Doge's Palace—the Campanile, or bell-tower—the clock-tower, and the Cathedral of St. Mark. The square contains over three acres of ground, and is beautifully paved with large flag stones. The Campanile stands in the corner, and the clock tower on one side. There is a colonnade round three sides of the square, back of which are brilliant stores and cafes. Along the fourth side of the square, runs a street, and just across the street is the gorgeous front of the Cathedral. To the right of the Cathedral is the Doge's Palace. It is in this square that the visitor will linger longest, charmed by the historical associations of the spot and the wonderful beauty and richness of its structures, and pleased by its life and gaiety, its variety of amusements, and the opportunity of observing the people, who come here in crowds in the morning to drink coffee, and in multitudes on pleasant evenings to eat ices and sweetmeats, hear music, and promenade. I doubt if there be another spot of equal size in the whole world where there is so much life and gaiety concentrated as in the Square of St. Mark. In the evening the rows of lamps all round the colonnades are lighted, and the agreeable southern air, and the dark blue sky, spangled with stars, combine to add fascination to the scene. The cafes, under the colonnades, are full of people, eating ices, and hundreds are sitting in chairs on the outside. Up and down, before the

VIEW OF ST. JOHNS, NEWFOUNDLAND.

St. John's, the capital of Newfoundland, is the most eastern seaport of North America. Being directly in the track of steamers plying between Great Britain and the United States, it is eminently adapted as a coal depot, or half-way house for these vessels. The harbor is excellent, although narrow at the entrance; the channel, or "Narrows," from point to point, being only 360 fathoms wide. The entrance to the harbor is so concealed from view at sea, that it is almost impossible to perceive it until after a very near approach. On the right rises Signal Hill, to a height of at least 680 feet, overlooking the town, and commanding a fine view of the country, which extends behind it like a gigantic panorama. Opposite Signal Hill, on the other side of the Narrows, rises another hill, or mountain as it should more properly be

termed, to an elevation above the level of the water, of over six hundred feet.

The city is built on the side of a hill, which ascends gradually to a height of about a hundred and fifty feet, and presents an exceedingly picturesque appearance. It overlooks the harbor, which is a little over a mile in length, and a quarter of a mile in width; and which is one of the best harbors in the world, affording at all times a safe anchorage for ships of the largest dimensions. The first thing that strikes the visitor is its peculiar formation. After you have passed the entrance, it has the appearance of a lake, so completely is it shut in from the ocean. Gigantic hills tower above you on every side, except that on which the city stands, and on their rough and rugged declivities little patches of gardens have been made by the

more industrious of the fishermen, whose little cottages help to subdue the natural wildness of the scene. Near the water's edge, on the south side, are erected the stages, or "flukes," as they are termed, on which the codfish are cured.

A very extensive business is done in St. John's, it being the chief commercial centre of the island. Large numbers of vessels are constantly in port discharging or taking in cargoes of fish or oil, and in the months of August or September some fifty to eighty Spanish vessels load with fish for the various ports in the Mediterranean. Seal oil usually finds its market in the various ports of Great Britain, while the codfish is sent to the West Indies, Spain, Naples, and Brazil. In 1850 the population of St. John's amounted to 19,000; in 1852, 21,000 (resident), 6,000 fishermen.

AUTHORS AS CONVERSATIONISTS.

Great writers are not necessarily great talkers. You hear that a man has written a popular book, and that you are to meet him at dinner. You hope that your own inferiority in conversation will not be very apparent, and, to be on the safe side, resolve to play the part of listener. You meet the great man, and vainly expect wit or wisdom from his lips. He turns out to be a very ordinary mortal. He may be shy and silent, or garrulous and bold, but he does not realize the expectations you had formed of him from his writings. A subject is discussed before him, and he either says nothing about it, or if he enters into the controversy, makes little of the subject, throws no light upon it, and leaves it where he found it. You go away, dreadfully disappointed, and cannot understand how a man can talk so tamely and write so spiritedly—how he can be weak as well as strong—how he can embody the poet's avowal that we are "half dust, half deity." A few months pass, and our author produces another book. You have the curiosity to read it, and are wonder-stricken at finding the difficult subject on which the author, in your presence, had either not spoken, or spoken badly, fully and luminously discussed,—research and analysis, reflection and sagacity, wit and pathos, wisdom and sentiment, poetry and philosophy, grace and earnestness, eloquence and refinement, all combining to illustrate it admirably, all making a *chef d'œuvre* which delights the Present and will fill the Future with admiration.

What, you may ask, in utter wonderment—what an extraordinary difference between this man's writings and his conversation; what a curious quality of mind, as it were, in one and the same individual? Well, there is a difference. He who was shy and silent, awkward, and perhaps commonplace in the crowd, was simply out of his element there and then. What a changed man you would see were you to behold him in solitude. A casual passage in a book, a passing paragraph in a newspaper may suggest an idea which, working into his mind, creates a train of thought, to carry out which, he is impelled to take pen in hand and write. One page leads to another, until he has discussed the subject in every point, and, in due season, the completed production, be it article or book, is before the world, challenging its need of approbation and enlightening its heart.—*Phil. Press.*

BUSINESS HABITS OF AARON BURR.

Mr. Parton's new work on Burr gives the following sketch of his daily habits in the latter part of his life, as related to the author by a gentleman who spent some time in Burr's office:—"He rose at the dawn. A breakfast of an egg and a cup of coffee sufficed for this most abstemious of men; after which he worked for some hours before his clerks and assistants arrived. He was a hard taskmaster; he 'kept us all upon the jump.' All day he was dispatching and receiving messages, sending for books, persons and papers; expecting every command to be obeyed with next to impossible celerity, inspiring every one with his own zeal, and getting a surprising quantity of work accomplished. 'He was business incarnate,' said my informant. 'About ten in the evening he would give over, invite his companions to the side-board, and take a single glass of wine. Then his spirits would rise, and he would sit for hours telling stories of his past life, and drawing brief and graphic sketches of celebrated characters with whom he had acted. Often he was full of wit and gaiety, at such a time; 'the liveliest fellow in the world,' 'as merry as a boy,' 'never melancholy, never ill-natured.' About midnight or later, he would lie down upon a hard couch in the corner and sleep 'like a child,' until morning. In his personal habits he was a thorough-going Spartan; eating little, drinking little, sleeping little; working hard. He was fond of calculating upon how small a sum life could be supported, and used to think he could live well enough upon seventy-five cents a week."

Refrain from bitter words; there is only the difference of a letter between words and swords.

The Young Ruralist.

BREAKING YEARLING STEERS.

MESSRS. EDS.:—In the last *RURAL* a Young Ruralist of Madison Co., inquires how to break his yearling steers. Permit me to suggest, first, not quite so much timber in our "or gods," as our fathers used, for lumber is becoming scarce, and brains are increasing, (scalps at least,) for which reason we had better use more of the latter and less of the former.

Next, we deserve no sympathy when we split our throats in trying to make our cattle bear, when nature gave care quite as acute, and nearly as long as our own. In other words let us retain our natural voice and natural actions—that is, actions in harmony with that principal in nature which Chasler taught—"overcome evil with good"—and the few who have experimented on this precept, have found it as often verified when applied to four legs as two.

Now, if the law of kindness will overcome evil, certainly no harsher agent is required to overcome ignorance, the only fault of the unbroken steer,—ignorant not of the act we wish him to perform, for he can do that—but, ignorant of our desire—and since we are as awkward in communicating our will, as the steer in comprehending it, therefore, we merit as harsh a chastisement as we inflict on him.

To illustrate my theory, I give my practice:—I raised a pair of Devon grade calves, which I fed, handled and made myself familiar with until one year old. By this time continued kindness had secured a sort of mutual confidence between all three of us; they seeming to consider me as good a calf as any in the yard. I now considered their moral and social facilities in a healthy and thriving condition, which should be the first step in the education of man or brute.

As the mild weather of spring approached, bringing with it a corresponding mildness in the disposition of cattle, manifested by their being more sociable in a yard, and not so given to hooking each other as in the more severe weather, I commenced their education, one at a time,—short lessons, each once a day,—and was surprised at their rapid progress, never having driven oxen or broken steers before. I did not attempt to cram the whole alphabet down them at once, which I believe is too frequently practiced. For twenty successive times the child may attempt to speak a hard word and fall every time,—when if you give him the elementary sounds composing the word, he will utter each distinctly,—then combine them by adding one each time, and he can pronounce it with ease. Parents, try it. If your child says *this* time, it is because he doesn't know where to place his tongue to produce the sound of *s*, not because he cannot do it. Let him see how you do it, &c. On this principle my calves acquired great accomplishments, and graduated shortly after one year of age.

When I had made myself intelligible to each I then let them recite in concert, changing sides and positions in all manner of ways I could think,—in short, acting on the principle of the cautious old lady, who said, "Johnny, you must not go into the water till after you have learned to swim." They were thoroughly broken before being yoked.

If I want the steer to come to me, I tap, tap, tap him, like the gentle rain drop, with my short lash on the left or opposite side of the neck. At first he cares nothing about it, till at last it becomes disagreeable to him, as the stroke from a straw on a man's nose or arm would at length be unbearable. Well, he makes a move to avoid his uncomfortable position, but naturally enough moves from me, knowing I am the cause, and my desire to the contrary being High Dutch to him. But the taps continue to fall just as fast as ever on just the same spot, till by mere accident or experiment he turns towards me. That instant the blows stop; so he at length finds that he must approach me to avoid the disagreeable sensation on the off side of the neck, and must move to the right when on the left side; but always strike on the same place to produce the same result, and not touch him promiscuously or just where it happens to produce a motion forward, backward, right or left. Be sure you always stop whipping the instant he begins to obey; this encourages him. To make them hold up their heads when yoked, tap them gently with the butt of the whip on the top of the shoulder just back of the yoke. To make them back, strike them on their breast or throat, as it saves their eyes and a downward tendency of the head.

To conclude, I took these steers to our County Fair at Watertown, in the fall, and although they had seen but one winter, were kind as kittens and handy as oxen, and took the first premium. I sold them on the ground for one hundred and twenty-five dollars, without the yoke, took the money and went home with a sad heart. Their weight was twenty-one hundred. Color deep red. J. B. Stowell's Corner, Jeff. Co., N. Y., 1859.

THE WONDERS OF LIGHT.

Not only does light fly from the grand "ruler of the day," with a velocity which is a million and a half times greater than the speed of a cannon ball, but it darts from every reflecting surface with a like velocity, and reaches the tender structure of the eye so gently that, as it falls upon the little curtain of nerves which is there spread to receive it, it imparts the most pleasing sensations, and tells its story of the outer world with a minuteness of detail, and a holiness of truth. Philosophers once sought to weigh the sunbeam. They constructed a most delicate balance, and suddenly let it in upon a beam of light: the lever of the balance was so delicately hung that the fluttering of a fly would have disturbed it. Everything prepared, the grave men took their places, and with keen eyes watched the result. The sunbeam that was to decide the experiment had left the sun eight minutes before, to pass the ordeal. It had flown through ninety-five millions of miles of space in that short measure of time, and it shot upon the balance with unabated velocity. But the lever moved not, and the philosophers were mute.—*Scientific American.*

When vice is united to fortune, she changes her name.

CUBA.

The fertility of the soil of Cuba is well known. The labor of cultivation is small and the profits well high fabulous. It is said that some planters, who have several estates, have an income of eight hundred thousand or a million of dollars annually. On new ground, sugar, which in Louisiana requires to be planted once in three years, will produce its annual crop for nine or ten years, so that the planter has nothing to do but reap the harvest every year. But notwithstanding these extraordinary inducements to cultivate the soil, by far the larger portion of the island is yet a wilderness. A published statement gives only one-twentieth part of it as under cultivation. Some part of the residue is mountainous and unutilized, but a very considerable portion is as fertile as that which yields so enormous a revenue.

In addition to the sources of agricultural wealth, there are rich copper and coal mines, and the forests abound with mahogany, cedar, and other choice woods. There are some serious drawbacks to a residence on the island, however, the principal of which are the enervating climate and yellow fever. A minor but by no means despicable evil is the mosquito, whose sting is very poisonous to strangers, producing a high degree of inflammation. The hands, wrists and ankles swell up and suppurate, making great sores, which leave pits almost as deep as those of the small pox, and much larger. After a residence of two years, however, the sting is scarcely felt, and the poison produces little or no effect. This has been accounted for by the idea that the enervating climate renders the blood so thin and poor that it is no longer capable of the same degree of inflammation.

SINGULAR CHINESE CUSTOM.—In China, coffins are made of very thick timber, and the joints are all carefully closed by pasting layers of paper over them, so as to make them perfectly air-tight. For greater security, a little lime is generally put in with the corpse. In this way it is possible to keep the coffined corpse in the house for years, without any unpleasant consequences. The practice, indeed, is not uncommon. Some have not the means at hand for burying in such style as they would wish. They must wait for better days.—Some do not find a place to suit them. Thus it sometimes happens that on entering a Chinese gentleman's house, a coffin is one of the most prominent objects seen among the articles of furniture.

AMUSEMENT.—Do you suppose that the grown-up child does not want amusement, when you see how greedy children are of it? Do not imagine we grow out of that; we disguise ourselves by various solemnities, but we have none of us lost the child-nature yet.

POVERTY is only contemptible when it is felt to be so. Doubtless the best way to make our poverty respectable is to seem never to feel it as an evil.

ROCHESTER, N. Y., NOVEMBER 27, 1858.

News of the Week.

A TELEGRAM from Washington on the 17th states that orders are to be forthwith sent to the naval forces in Central America, having in view the enforcement of the President's anti-filibuster proclamation.

SECRET agents from persons in high standing in Mexico, are said to be at Washington urging the President to decisive measures in relation to that country.

A SPECIAL session of the Indiana Legislature convened on the morning of the 20th. The House organized by the election of J. W. Gordon, Rep., Speaker; A. J. Ryan, anti-Lee, Principal Clerk; G. N. Chapman, Rep., Assistant Clerk; and Robert Jennings, Rep., Door Deeper. In the Senate, J. H. Vawter, anti-Lee, was chosen principal Clerk, and James Ljnor, Rep., Assistant Clerk. Both Houses then adjourned.

THE Legislature of North Carolina convened at Raleigh, the capital, on Monday week and both houses were full. Henry T. Clarke, of Edgworth, was elected Speaker of the Senate, and Thomas Settle, of Rockingham, Speaker of the House. Hon. John Hill, Clerk of the Senate, and Edward Cottrell, Clerk of the House. Gov. Bragg's message was delivered and was well received. There are several aspirants to the U. S. Senate, and the election will be made at an early day.

COMPLETE returns show a majority of 15,372 against a Convention to revise the Constitution of New York. The aggregates are for a Convention 139,748; against 155,120.

THE Litchfield (Conn.) Bank—one of those crippled during the late panic on account of some mismanagement—had a hearing before Judge Ellsworth, at Hartford, on the 15th. The Bank Commissioner reported the Bank insolvent, and not in condition to go on. It was enjoined and Abijah Cadin and F. E. Harrison were appointed receivers. Four months is allowed for the presentation of claims against the Bank. The affairs of the Bank are now in a bad condition, but the receivers are said to be practical men, in whose hands every dollar will be applied for the benefit of creditors.

CONFLAGRATIONS.—The period of the year when the eye instinctively turns to telegraph columns expecting to read of "Destructive Fires," "Terrible Conflagrations," &c., has arrived, and we are daily receiving instalments of such matters. On the 20th, in Norwalk, Conn., twenty buildings, embracing stores and dwellings, were burned. Loss \$75,000. A destructive fire occurred in the village of Corunna, Shiawassee Co., Mich., on the 17th, which swept a good portion of the town between the Court House and River. This includes the main business part of the village situated west of the Court House. The loss is estimated at about \$50,000, with only about \$5,000 insurance.

Arrival of the Overland Mail.

THE Eleventh Overland Mail from California, with dates to Oct. 22d, arrived at St. Louis on the 16th inst. The following summary of news was received by the American Express:

The exceeding regularity in the arrival of the overland mail from St. Louis had excited the wonder of our San Francisco contemporaries. The second was set down on the 14th, and the third on the 17th. They speak of the demonstration made on those occasions as past all description. The *Alta California* records the incoming of one of the St. Louis mails in due time, notwithstanding a protracted detention by the way:—"The overland mail stage of Messrs. Butterfield & Co., left St. Louis on Sept. 20th, the same day that the mail steamer now due sailed from New York. The stage arrived at San Jose this morning at 10 o'clock, having been delayed 37½ hours at Fort Smith, Arkansas, waiting for the Memphis mail.—It will be seen that the actual running time is but 23½ days, thus beating the steamer, via Panama, entirely 'out of sight.'"

The *Stockton Argus*, in a late issue, throws a new light on the massacre of Crabbe and party in Sonora about a year since. That journal says that Crabbe was lured to Sonora by Pasquiers, under the promise of being permitted to occupy a large grant of land between the Mexican settlements and the hostile Apaches for the avowed purpose of protecting the inhabitants against the incursions of the savages. Pasquiers, it seems, had another scheme in view, which was to join the Americans in a movement for the annexation of Sonora to the United States, should he fail to establish his supremacy through the revolution at that time distracting the State. Gaudara, his opponent, then in the city of Mexico, denounced him to the General Government, charging him with treason. Fearing the consequences, Pasquiers, to establish his innocence of the charge, coolly murdered the party he invited thither, and sent an account of the butchery to the city of Mexico, as an evidence of his loyalty.

The Chili Congress had closed its session—one of its last acts having been a bill authorizing the Executive to purchase shares of the Valparaiso Santiago Railway Company. The limit for buying is confined to the next six months—the State assuming the same rights and prerogatives as individual shareholders. In the agricultural districts in the south, the crops promise to be plentiful, notwithstanding the excessive rain which has fallen. From Peru there is little of interest. Trade is extremely dull on account of the unsettled state of Bolivia, as the merchants refuse to sell on credit. At the time of the steamer's leaving there were forty-one vessels loading at the Chincha Islands, and forty-two lying in the harbor of Callao.

THE KANSAS GOLD MINES.—By U. S. Express to Boonville, on the 12th inst., we learn that favorable accounts continue to arrive from the gold regions. Seven men of the Georgia Company took out \$500 in five days. Upwards of 600 wagons bound to the mines were met last week between Fort Kearney and the crossing of the Platte. Arrivals from Utah, report six inches of snow on the Sweet Water, and ice an inch thick. Twelve hundred Indian lodges were erected in the vicinity of Military Road, between this point and Fort Laramie. The Indians are peaceable.

TREMENDOUS PILES OF GOLD.—The bullion in the Bank of France now stands at about \$120,000,000—a far larger sum than was ever before held by that establishment, and more than \$8,000,000 in excess of the largest sum ever collected in the Bank of England. At the commencement of the present year, the Bank of France held less than \$40,000,000, and the influx in nine months has therefore been \$70,000,000. At the Bank of England, the total at the beginning of the year was \$53,000,000, and it is now more than \$95,000,000. The highest sum it ever possessed was \$111,000,000, in July, 1852.

CANADIAN RECIPROCITY.—The New York Chamber of Commerce held a special meeting on the 11th inst., at which the Committee on Canadian Reciprocity presented a report complaining of the forced interpretation recently placed on the reciprocity treaty by Mr. Guthrie, by which interpretation wheat grown in the States, and ground into flour in Canada, is subject to duty on re-importation into this country. Royal Phelps presented a minority counter report.

SYRACUSE SALT.—Notwithstanding the general depression, the quantity of salt inspected at Syracuse exceeds the amount inspected during any preceding year by about 200,000 bushels. The aggregate for the season will be nearly 7,000,000 bushels, or 1,400,000 barrels, valued at \$1,000,000. About one-half the salt manufactured in the United States, is produced there.

THE NEW CANADA COIN.—The Toronto Globe has received information that an instalment (\$400,000) of the monies stamped in England for Canada, arrived out by the Indian, and will be put in circulation immediately. They consist of ten and twenty cent pieces in silver, and one cent pieces in bronze, very beautifully executed.

A SINGULAR VOTE.—At the late election in Massachusetts, the town of South Danvers voted as follows:—Banks, Republican, 444; Beach, Democrat, 444; Lawrence, American, 444. That town was very impartial in its favors, and determined that no party should have cause to complain of it.

NEW YORK FOR SALE.—The Sheriff of the county of New York, advertises for sale all the real estate of which the city of New York was possessed on the 12th day of June, 1857, "or any time thereafter," to satisfy sundry executions placed in his hands.

EQUADOR AND THE ENGLISHER.—The English are stated to have received from Equador a vast region at the upper waters of the Amazon, along under the Andes, which they are preparing to occupy with all the means and men incidental to an extended scheme of colonization.

GREAT DEBTS.—The debt of Russia is said to amount to \$352,800,000. That of France is \$1,248,000,000, and that of England \$3,295,000,000. Rather large sums, but the resources of all the three nations are immense, and their credit is excellent.

News Paragraphs.

A FOREIGN paper states that the caravan of pilgrims which left Damascus for Mecca last summer, accompanied by the Sultan and her suite, returned to Damascus on the 25th of September, its ranks decimated by the cholera. Of the eighty thousand persons who composed the caravan, sixteen thousand were carried off by the epidemic. The Sultan and her entire suite, with the exception of a young Georgian slave and an old eunuch, are among the victims.

A "LAND LOCOMOTIVE" successfully traversed the streets of Dayton, Ohio, recently. It is designed for draft on the farm, in plowing and threshing, and other labor, and for use on the highways.

HON. WM. SMILEY, formerly Governor of Georgia, and afterwards one of her representatives in Congress, died at Augusta on the 20th, aged 72. He was a native of Maryland, a good lawyer and a good citizen.

THE Third Avenue Horse Railroad Company, in New York, estimate the number of people carried over their road during the year, at about eight millions. Nearly four thousand miles per day are run by their sixty-nine cars and twelve stages. The receipts from passengers during the year were \$402,679.

A GRAIN warehouse has been erected at Milwaukee which is capable of storing nearly half a million bushels of grain. There are six elevators, which in the aggregate are capable of taking in 11,000 bushels of grain in one day, and two ship elevators, which will ship 24,000 bushels an hour.

THE yield of vineyards in Hamilton county, Ohio, for 1858, is 14,000 gallons; Brown county, 17,000; and Clermont, 2,500—a total of 33,500 gallons in three counties. The wine of 1858 is of superior quality—as good as the celebrated vintage of '63—and the yield is considerably greater than that of '57. The price per gallon ranges from \$1 to \$1.20.

ABOUT thirty acres of land in Winthrop's Neck, in New London, Conn., has been fenced in by squatters during the past summer. At the time Arnold burned the city, the records were destroyed, and no owners have claimed the land, which has been unoccupied since then.

THE Utah correspondent of the N. Y. Tribune, says the Mormons have left their fields just as they were after the harvest. Not one has been broken up and sowed with wheat for the next year's crop, nor have any preparations been made for that purpose. This is the case, so far as he could learn, throughout the Territory, and is regarded as indicating that the Mormons will be off next spring, to what place or in what direction is an utter mystery.

THE Supervisors of Oneida county refused to levy the State Tax of 1855, and were sued. The State obtained judgment, and now they have the snug sum of \$25,000 to pay. Comptroller Church urges the immediate payment of this sum.

SINCE Morphy has been in Europe, up to the time of the close of the Harwitz game, he has played 117 games, 16 of which he lost, 88 won, and 13 were drawn.

SKATING ponds are to be the institution this winter. Some of the residents of Delaware avenue, Buffalo, it is stated, are to have a private skating ground, a large lot of land on the avenue having been leased for the purpose, which is to be flooded with water. The ladies are preparing to participate in the healthful exercise.

LETTER boxes have been placed in some of the Philadelphia passenger railway cars, and on the latter reaching their terminus, near the Exchange, the contents of the boxes are deposited by the conductor in the Post Office. It is found to be so great a convenience to suburbaners, that all the numerous cars will probably be supplied in the same way.

TELEGRAPH TO THE PACIFIC.—The Washington correspondent of the Baltimore Sun says that arrangements have been made by the Southern and Western Telegraph Companies to continue the line of telegraph from Missouri to California and Oregon. The efforts of the companies on this side of the Rocky Mountains for this object will be aided by companies formed in California. The proposed line will be for the most part laid under ground, and for a considerable distance on the Pacific slope, may be conducted, it is said, upon the tree tops. The expense of construction will not, it is said, be very considerable, in proportion to the benefit, public and private, to be derived from the line.

DACOTAH.—The people living in that part of Minnesota not included in the boundaries of the new State of that name, have acted upon the principle of "Squatter Sovereignty," and formed a government of their own, under the name of Dacotah, with the seat of government at Sioux Falls, on the Big Sioux river. A Council and House of Representatives have been elected, which convened on the 15th ult., and elected a Governor, who accepted the office and made an Inaugural Address. Congress will find this new community at its doors next winter.

ANOTHER SUBMARINE CABLE FAILED.—The submarine cable from Dover Calais has ceased to do telegraphic duty. It has been in successful operation for years, and its failure now is proof positive that the modes of insulation as yet discovered are inadequate for permanent communication under salt water, even for a short distance. This renders the case of the great "Atlantic Cable," in its present predicaments, utterly hopeless. At the best it could not have been relied on for a great length of time. New inventions and substantial improvements, however, making electric communication across the Atlantic a fixed success, are not to be despaired of.

THE GIRL RESCUED FROM THE MORMONS.—Judge Eckles having in charge Henrietta Polivore, who was rescued from the Mormons by habeas corpus at the request of the British government, arrived at St. Louis on the 10th inst. This girl was abducted from Gloucester, England, four years ago. Elizabeth Colton, author of an extensively published letter in regard to Mormon life, had also arrived, en route to her home in England.

Literary Notices.

A JOURNEY DUE NORTH: Being Notes of a Residence in Russia. By GEO. AUGUSTUS SALA. Boston: Ticknor & Fields—1858.

This is a most delightful, entertaining and instructive account of a residence and journey through Russia in the Summer of 1856, by one of the ablest and most piquant and interesting contributors to "Household Words" and other English publications. Its descriptions of Russian life, habits and characteristics—in city, village and country—are given in such an amusing and entertaining style, that the reader peruses the volume of 550 pages with unflagging interest and pleasure. Sold by DEXTER.

VERNON GROVE; or, Hearts as they Are. A Novel. New York: Radd & Carlton.

This is one of the few novels of the day which we consider worthy of commendation. It is written in a chaste and charming style, and depicts the emotions and passions in a natural manner—truly representing "hearts as they are." The volume comprises nearly 400 pages, handsomely executed. For sale by DEXTER.

A SPLENDID HOLIDAY GIFT BOOK.—We are in receipt of specimen sheets and plates of a splendid gift book soon to be issued in Imperial 8vo. by D. APPLETON & Co., entitled "The Stratford Gallery; or the Shakespeare Sisterhood." It is to comprise forty-five ideal portraits, finely engraved on steel, with letter-press descriptions by Mrs. J. W. PALMER, an accomplished writer. The plan of the work is original, and we think it will prove one of the most attractive and beautiful volumes ever issued in this country. It will prove a counterpart, and fitting companion to the "Republican Court" of Mr. Griewold, "World-Noted Women" by Mrs. Mary Compden Clarke. The Gallery will soon be for sale by DEXTER.

"THE AUTOGRAPH OF THE BREAKFAST TABLE."—The incomparable series of papers which Dr. O. W. HOLMES contributed to the Atlantic Monthly under this title, will soon be issued in a handsome volume, with appropriate embellishments and illustrations. We presume the work will be rich in all respects—for it certainly will be in contents, and as to externals the eminent publishers (FISHLIPS, SAMSON & Co.) will no doubt perform their part creditably. Thousands will be glad to receive the Autocrat in boards, and even calf, for he is considered an "institution" worthy of preservation.

—Since the above was written we have received the book, and find it "all our fancy painted."

THE *Edinburgh Review*—LEONARD SCOTT & Co.'s reprint—has been received. Its contents are:—Memoirs of the Court of England During the Regency—1811-20; Report of the Trial of Madeline Smith, at Edinburgh; History of Ancient Pottery; M. Guizot's Historical Memoirs; Contributions to the Philosophy of Vision; The Earls of Kildare, and their Ancestors; Studies of Homer and the Homeric Age; Guy Livingston, or Thorough; The London Cotton Plant; The Edinburgh Review, and Mr. Froude's History. This list is an attractive one, giving a rich variety of entertaining matter to the reader. One of the most venomous vilifications of America and American Institutions may be found in the article entitled "The London Cotton Plant"—one of a character, we are happy to say, very seldom found in pages more marked for elevated criticism. It is well enough to know what our detractors say of us, and when truth fails to develop as foul a picture as this class would portray, their ready acceptance and use of falsehoods conclusively show that we are not irrevocably beyond the pale of redemption. For sale by DEXTER.

"Rural" Letters from the People.

THE CLERGY are, and ever have been, among the most ardent friends of the RURAL. We are indebted to this intelligent and discriminating class for the introduction of the paper in many localities, and a large increase to its subscription list in numerous others. Their personal influence is great, and has been kindly lent in support of the RURAL. To show what one has already done for our next volume, we extract the following from a letter just received from a Clergyman in Northern New York:—"I hasten to inform you that I am in the field canvassing for the RURAL when my health will permit. I have already obtained over SEVENTY subscribers! The *Tribune* and *Ledger* out of the way and the field would be clear, but I am abundantly satisfied. If my health and strength hold out, think I shall make a goodly list. Have received your handsome poster. As part of my gospel consists in preaching the RURAL and its doctrines, had you not better send some more at the different points where I am itinerating? Also a few specimens. Keep the ball rolling! I cannot afford to write often, except to send names, till I get through canvassing." Our friend is evidently a wide-awake, progressive man, as well as minister. How many Country Clergymen will benefit their parishioners, and aid the RURAL in like manner?

THOSE who have taken the RURAL at the East, and removed to the West or South, prove excellent missionaries, as we have frequent occasion to know. Witness the following note just received from W. L. HUNTER, now residing in Nodaway Co., Mo.:—"As an Eastern man always loves the RURAL for its high tone and good influence, I miss it sadly; and as the general information of the people is very deficient, as a teacher I consider it my duty to do what I can for them. Therefore, if you will send me a few copies for distribution, I will try to get up a club."

THE YOUNG MEN are waking up, and making efforts in behalf of the RURAL. A young man in Tompkins Co. requests us to send Specimens, Show-Bills, &c., to his father in Pa., and says:—"I have been a reader of your paper a number of years, have taken it the two past years myself, and I intend to take it as long as I can get money enough. I purpose to give you a lift this coming winter. As much of my time as I can spare shall be spent in trying to aid in circulating the best paper in the world."

FRUIT IN ITALY.—An American traveler says:—"I have not yet seen either in the markets or grape yards of Southern Europe anything that would compare with the fruit displayed at our annual shows. Not only in the large grape yield, but in other kinds of fruit, this will be a bountiful year in Tuscany. Figs, pears and peaches are in uncommon abundance; indeed, the last named are about as plenty, good and cheap as with us during a favorable season in New Jersey. Of fresh figs, fifteen to twenty, can be bought for a craze, little more than our cent. The olive yield does not promise so well as usual, which may oblige the Florentines after this, to pay a little more for the oil they burn in their lamps and eat on their salads. The past summer has been a very comfortable one in this part of Italy. There were only a few days of excessive heat, and, indeed, rarely is any great inconvenience felt on that account."

THE QUARANTINE TROUBLES.—The N. Y. Express of the 20th inst., states that extensive preparations are being made for a second attack upon the Quarantine establishment. Meetings have been held at Staten Island, and a large band is being raised. The plan of attack, the Express states, is entrusted to an officer of the U. S. Army, who is to receive a large sum of money if he is successful.

The News Condenser.

- St. Joseph, Mo., is now lighted by gas.
- Madame Pfeiffer, the celebrated traveler, is dead.
- N. Y. city pays \$969,000 for police, or \$2,600 per day.
- The census of the population of Spain foots up 15,494,330.
- There are now 1,249 students in Oberlin College,—513 females.
- A horse was recently sold in New Bedford, Mass., for fifty cents.
- N. Y. city pays \$400,000 for lamps and gas, or about \$1,100 per day.
- Twenty bears have been killed in or near Wilmington, Vt., this year.
- N. Y. city pays \$480,000 annually for salaries, or about \$1,300 per day.
- Papers from Texas, of Nov. 6th, report a heavy frost through that State.
- A canary known to be twenty-one years old, died recently in England.
- N. Y. city pays \$350,000 annually for cleaning streets, or about \$680 per day.
- N. Y. city pays \$1,400,000 for public schools annually, or about \$3,800 per day.
- Letters from the cotton growing region say the crop may reach 3,500,000 bales.
- The distance from St. Louis to San Francisco, by the Overland route, is 2,886 miles.
- Brigham Young lost \$10,000 by the failure of a banking house at Washington lately.
- "No gold at Pike's Peak" is the last reliable report from the Kansas "gold region."
- N. Y. city pays \$800,000 annually in support of almshouses, or about \$2,290 per day.
- Bernum is delivering a lecture on "Money-making" to large audiences in England.
- The Mayor of Cincinnati has stopped the running of omnibuses in that city on Sunday.
- The banking capital of Baltimore exceeds \$10,000,000—divided among twenty-one banks.
- The new submarine cable had been laid between England and Aldborough and Holland.
- A large arrest of bogus coin manufacturers has recently been made in Lawrence Co., Ohio.
- Steps are being taken in New Orleans for constructing horse railroads within the city limits.
- Of 53 parcels of real estate offered at sheriff's sale, in Cincinnati, last week, only one was sold.
- A merchant of Alexandria recently charged the Viceroy of Egypt \$300,000 for twelve mirrors.
- The business men of Milwaukee opened their new "Chamber of Commerce" on Wednesday last.
- The town of Mattapoisett contains 70 persons who have attained the age of 70 years and upward.
- At Fort Brown, Texas, there have been 43 yellow fever deaths in the garrison and 370 at Matamoros.
- The bills of the Atlantic Bank, Portland, Me., were not received by the New York bank on Tuesday week.
- The New York Canal Tolls for October show an increase of \$98,016 36 over the same month last year.
- The canal tolls for the first two weeks of November are \$13,370 in excess of the same period last year.
- The passenger depot of the Great Western Railroad, at Chatham, C. W., was burned on Monday week.
- Charles Hale, of the Boston Advertiser, is a prominent candidate for speaker of the Massachusetts House.
- The Leavenworth (Kansas) Times, says the telegraph wires will reach that place by the close of navigation.
- Throat diseases are said to be the most fatal and prevalent of any among the rising generation of California.
- A steam engine is ordered from Philadelphia for the Empire Hook and Ladder Company of Lancaster, Pa.
- The Charleston (S. C.) Courier of the 10th inst., reports ice and snow in some parts of the State on the 8th.
- The Illinois Institution for the Deaf and Dumb has one hundred and fifty pupils, and is in a flourishing condition.
- The Supreme Court of Tennessee has just decided that the use, in public, of a single oath is an indictable offense.
- A large naval force will soon be sent to the Gulf, with a view to the execution of designs on Mexico and Cuba.
- A rich gold mine has been discovered in Western Arizona, on the line of the El Paso and Fort Yuma wagon road.
- John Fowler, an American dentist residing in Paris, has bought Monte Cristo, the residence of Alexander Dumas.
- Powers, the sculptor, is about to revisit the United States. He has now resided in Florence upwards of 20 years.
- A boat, containing three colored men, went over the falls at Towanda, Pa., on Sunday week, and all were drowned.
- The exports of coal from Great Britain to the United States during the month of September, amounted to 8,160 tons.
- The prize money to be paid to the military serving in India is enormous. Lord Clyde's share is said to exceed £80,000.
- Prof. Henry D. Rogers, of Philadelphia, geologist, has recently been elected a member of the Royal Society of London.
- The latest statistical accounts, derived from the Russian census of 1857, give to European Russia a population of 57,227,700.
- The Methodists of Alabama have raised \$300,000 as a beginning for an endowment fund for a University at Greensborough.
- The Newburyport Herald states that one man has purchased 10,000 barrels of apples lately, in that vicinity, for a Boston firm.
- Six Artesian wells have been bored in Toledo, from which a constant flow of water is obtained. None were sunk below 300 feet.
- The Santa Fe Gazette says that 115,000 sheep will be driven from two counties in New Mexico to California this present season.
- The teams on the Overland California Mail route travel from three to five, and in some parts of the route, nine miles the hour.
- Rev. C. H. Spurgeon, the popular preacher in England, has been attacked with a painful disease—inflammation of the kidneys.
- The N. Y. board of education estimate that \$1,296,000 will be necessary for public instruction in that city during the coming year.
- A bill has been introduced into the Legislature of Georgia to prevent the use of any Latin phrase in the legislative acts of that State.
- The Newburyport fishing vessels have all returned but two. The catch has been small, and generally the business has not been paying.
- The new treaty with Japan is on its way to this country in charge of a son of Gen. Tatnall, who is coming home by the overland route.
- The N. O. Picayune rejoices over the appearance of the street musicians in that city. They ceased in July and did not resume until 3d inst.

Choice Poetry.

Written for Moore's Rural New-Yorker
THE "ENVOY EXTRAORDINARY."

BY A. H. SULLOCK.

A LEGATE with summons no one can avoid
Comes bearing the signs of woe,
Emblems and tokens all blessings enjoyed,
By whom Strength and Beauty are rent and destroyed,
To whom treasures most valued must go.

He comes in a ghastly and terrible form,
Beheld with a soul-thrilling awe—
Appears at all times in the sunlight and storm,
When stern Winter is raging or Summer glows warm,
And is governed by no human law.

No place is exempt for his cruel display
Is witnessed on ocean and land,
Thro' the halls of a nobleman carries dismay,
The hand of no monarch his message can stay,
In the lowliest cottage he'll stand.

Suspend all his doings, so heinous and rash,
And man could have little to fear,
The shock of an earthquake, the swift lightning's flash,
The horrors of shipwreck, the hurricane's crash,
Would but Nature's grand pastimes appear.

Now comes from the cannon, now gleams on the sword,
And next in dark silence draws nigh,
To some sends a herald like ancient proud lord—
To others approaches without sign or word—
And none from his presence can fly.

At no time is idle, by night or by day,
In his mission of mourning and sighs;
Has agents in stubborn and countless array—
Can neither be flattered or bribed to delay—
In slaughter all tyrants outvies.

Though monster as frightful, in memory dear
We cherish the scenes of his wrath,
Remembrance wrings from us the heart-swelling tear,
Yet relieves most precious in this lower sphere
Are acts which have darkened his path.

Partially marks his ferocious career—
Some skies oft bedimmed by his breath,
Leaves others 'till twilight resplendent and clear,
No appeal from his sentence, however severe,
For he is the Angel of Death.

North Almond, N. Y., 1868.

The Sketch-Book.

Written for Moore's Rural New-Yorker.

THE THREE HOMES.

REASON'S whole pleasure, all the joys of sense,
Lie in these words—health, peace, and competence.

See you yonder mansion embosomed in the
foliage of those lofty maples. See you the spacious
park and pleasure ground with which it is sur-
rounded. And, as we draw nearer, mark the
elegant workmanship displayed in the edifice. It
is evidently the work of much care and expense.
Indeed, there seems to be nothing wanting that
could add, in any way, to the beauty and stately-
ness of the dwelling. The architect has undoubtedly
done his best, and has succeeded admirably. Ah!
think you, surely happiness resides there, where
all is so elegant and lovely? Nothing can mar
their joy, for everything wished for is theirs. If
such is your conclusion, let us enter and ascertain
whether it be really true.

We are admitted by a servant, who ushers us
into the drawing-room with much ease and politeness,
and we immediately perceive that plenty
reigns within, as well as without. But why is it
that every countenance is indicative of that
which we thought to be a stranger there, viz., sor-
row? Ah, we soon know the reason, as we enter
another apartment. There, in his little orb, is the
only pet of the household, the darling little one,
just planting himself for his flight to the "Happy
Land, far, far away." The patter of his little foot-
steps is no longer heard—his childish glee is
hushed—his playthings are to be put out of sight,
and the many fond hopes of the parents soon to
be crushed.

"But three short years have flown since our
hearts were gladdened by our baby boy, and can
it be that he is so soon to leave us forever? Oh!
my darling, my angel baby, I cannot, cannot let
you go."

Thus spoke the agonized mother as she clasped
for the last time that loved form to her bosom in
an agony of grief. Here was not that holy sorrow,
alleviated by the thought that He that afflicts is
He that blesses, and whether He send joy or grief,
I receive it as from a father's hand, knowing that
"He doeth all things well." Ah, no! she feels that
it is cruel to take her darling at this hour, and she
is ready to condemn the justice of that Being who
gave and hath a right to take again. Oh, had she
the consolations of religion in this hour of
grief, would she not draw nearer her Maker, know-
ing that "the strokes are lighter as we draw
nearer him who handles the rod." But, as she
looks in speechless agony upon her dying boy,
mark the smile on his countenance, and—hark!
he whispers, as he raises his tiny hand—"Mamma,
I'm going to hear the music—pretty music,
mamma," and the spirit of that cherub boy is
wafted nearer and still nearer to that heavenly
music which charmed his ear while still on earth.

And now what is there in that lonely and sunless
dwelling to cheer the hearts of those bereaved
parents? Can riches bind up the bleeding wound?
Ah, no!—riches could not prevent the Angel of
Death from entering there, and now they are no
balm to the broken heart. The bereaved and sor-
rowing ones look around upon all their wealth
and splendor, and they seem only a mockery, for
the little loved one—the sunlight of their home—
will not come again. And as we turn away we
lawfully exclaim—Riches, without health, cannot
produce happiness.

See you that low-roofed cabin, situated near the
outskirts of yonder forest. The sunken roof and
crumbling walls plainly show the handiwork of
the destroyer, Time. The windows are stuffed
with rags of every description, which are made to
supply the place of the vacant window glass. The
old, broken-down fence is no barrier to the cattle
on the common; the yard and garden are over-
grown with weeds and bushes, and everything
bears the mark of poverty and neglect. It is
evident that something is not right there, else why

able look of dilapidation which everything wears.
We see around the door various specimens of
humanity, their clothes hanging in tatters, and in-
stead of sunny faces and buoyant, happy hearts—
as children are wont to have—their faces are drawn
down to an indescribable length, and we need to
cast but one glance to ascertain that their hearts
are the abodes of much that they were better
without. We enter the house through a door so
low that no person of middle size can pass in
without stooping. We are greeted by a pale, care-
worn woman, who kindly, yet wearily, offers us the
only chairs the room contains. She is tall and
spare, but with a countenance that would be
pleasing, were it not so indelibly stamped with
sorrow—which circumstance immediately interests
us in her favor, and we kindly inquire of her the
cause of their reduced circumstances.

"Twelve years ago," said she, "I was a merry,
laughter-loving girl of sixteen. I was blessed
with a good home and kind parents, and as I was
an only child no pains were spared that could
contribute, in any degree, to my happiness. I was
thus in the midst of every enjoyment, when I first
met him who is now my husband. He was a
pleasant, gentlemanly young man, and ere many
months had elapsed I had promised to become his
wife. We were married, and comfortably settled,
and everything, for a time, went on prosperously.
A precious charge was given to my keeping, which
I earnestly resolved to train up in the paths of
virtue and holiness. Alas, for the fond hopes of
life; how often are they forever blasted. It was
with feelings not to be described that I first
discovered that he who was as dear as life to me
was a lover of the wine cup, and daily drank of
the poisonous liquor. Where were now my long
cherished hopes and bright anticipations for the
future? In one short moment were they crushed,
for I knew how seldom it is that he who drinks at
all remains a temperate drinker. And my fears
were soon realized. He began to grow worse and
worse, and often came home intoxicated, and my-
self and children were generally the objects of his
fury. Our little property was soon wasted, and
poverty began to stare us in the face. But I might
have had more fortitude to bear with that, could
we have had peace. My children, instead of walk-
ing in the path that I had marked out for them,
began to catch the spirit of contention which they
saw their father manifest when under the influence
of liquor, and as he then encouraged them in it, it
soon began to be a continual scene of wrangling
and discord. All my efforts to counterbalance the
unhappy influence of the father seemed in vain,
so prone is the human heart to cleave to the evil
and shun the good. I then felt the truth of the
words 'Lovely art thou, Oh, Peace! and lovely are
thy footsteps in the green valleys!—and I earnestly
longed that peace might become an inmate of our
humble home. It is thus that you find us, and
you now know by what, to me, unavoidable means,
we have sunk to our present miserable con-
dition. Oh, that every rumrunner in our land
might experience, if but for a day, the awful
misery their traffic entails on their unhappy
victims. I pray God the time may soon come
when this dreadful curse shall be done away with,
and our land become a temperate and a happy
land."

We leave this unfortunate family with the ques-
tion—Can happiness dwell with wrangling and
poverty? If so, why is not that care-worn mother
happy? Where, then, shall we look for happiness?
We have been in the dwellings of both the rich
and poor, but have not found that for which we
sought. We begin to fear that it is rarely if ever
found, and picture in our minds what a home must
be to render us happy, when we notice that we are
approaching a neat and comfortable looking farm-
house. It is a white house with green window-
blinds, and over the portico is trained, with ap-
parent care, a beautiful honey-suckle, which com-
pletely screens the inmates from the eye of the
outside observer. The yard is ornamented with
trees and shrubs of various kinds, which—many
of them being in blossom—all the air with a deli-
cious perfume. As we approach the house the
sound of cheerful voices greets our ears, and the
merry laugh of children, tells us that they, at least,
are happy. How different, think we, from the
children of the former unfortunate family. As
we enter the house we find that everything bears
the mark of care and neatness. The floor is nicely
sanded; the fire-place is filled with evergreens, and
upon the mantel-piece stands a beautiful vase of
freshly-gathered flowers. The matronly woman
that greeted us as we entered is called mother by
the playful group of children that surround her,
and indeed she is such a mother as we do not find
in every house. How tenderly she soothes the
grieved and sorrowing ones; or gently, yet firmly,
husbes the too rude and boisterous merriment of
her juvenile band. The older children are busily
employed upon something useful, to add to the
comforts of their beloved home. Perfect harmony
pervades the household, for if the younger scatter
discord, the willing hands of the older are soon busy
in restoring order. No harsh words or idle bicker-
ings are heard among the children, for their
parents have early taught them that where quarrel-
ing is, happiness fleeth. And to such a home
comes the weary father at night, after a day of
hard labor in the scorching sun. But, methinks,
the thoughts of his return at evening cheered him
through the long, long day, and his labor seemed
lighter as he raised his heart in thankfulness to
his Maker for the unpeaking blessing of such a
wife and children. And as they draw around the
family altar, as the shades of evening enfold
them, the father's voice is heard thanking God for
the blessings of the day that is closing, and im-
ploring His protecting care through the days that
are to come. And as the fervent petition rises
like golden incense before His throne, we feel that
here is the abode of happiness and content, such
as might satisfy any one who participated in it.
It is not great wealth that constitutes their hap-
piness, for that they have not; but enough to supply
all their needed wants is theirs, and it is sufficient.
Here also is health, and peace—not only the peace
which is the absence of strife, but that "peace
which passeth all understanding," and who can
wish for more. Surely, no one whose chief aim
is happiness in this world and in the world to
come. Great wealth brings with it many cares and
troubles which the poor know nothing of. Poverty
is attended with much suffering and sorrow, and

without health no one can enjoy life to the full
extent. Do we possess the blessings of Health,
Peace and Competence? If so, are we thankful
for them, and do we remember from whom these
blessings flow?
North Adams, Hillsdale Co., Mich., 1868.

ROAD PICTURES.

The general judgment of mankind looks to the
struggle of the battle-field alone for its examples
of bravery. It calls him courageous who, it may
be, made his movement forward in an excitement
that amidst the roar, and fire, and smoke, gave no
space for any other emotion than impulse. That
determination in which the results of the action
are thought out, is an incident of bravery not al-
ways connected with the deeds for which orders
are clapped upon arms, and ranks bestowed. "The
Iron Duke" declared the bravest man at Waterloo
was the one who shut the gates of the chateau of
Hugomont in the face of the French infantry.

The physician who takes the hand of the sufferer
in whose veins is the death-tide of malignant
fever, is brave beyond the smoke covered soldier.
The men who entwined the fibres that form the
great strands that support huge burlthens across
the Niagara, bent and tied the pliable iron while
the passionate rapids were furious two hundred
feet beneath them, and their only platform was
itself a wire—the men who take the heavy plates
to the centre of the fierce St. Lawrence, and rivet
the tubes of that wonderful bridge—these face
danger with the calmness that makes the act true
bravery, and they labor to make life long and
happy; the man of the battle is brave in his efforts
to make it short and bloody.

At the station at Syracuse, there is assigned to
Mr. GLINN the duty of arranging each day to
which of the engines the several trains are to be
assigned, so as the hour of departure for each
comes, the engine will be found in readiness to
take its burden.

He was for a number of years an engineer in ac-
tive service, distinguished for courage and for
prompt resolution. There are some instances of
this, which by their incidents ought not to be
omitted from the roll of truly brave deeds done by
men.

He was at his bar, his engine careering on with
the speed that only steam's strength can give, the
road was clear, the busy wheels kept their regular
roll, the huge drivers beneath his seat made swift
circling, and they who in the cars were borne on-
ward, knew no obstacle in their journey. Every-
thing moved on according to the card, and they
who were by the roadside found the car marking
by its passage the moment as accurately as if it
was the hand of a great dial. Suddenly he dis-
covered a small object near the rail. The human
vision grows sharp beyond the optician's art in
such an instant. The object moved, assumed form,
became only too apparent. It was a little girl
playing with the dirt between the rails!

One may in the race pull the blooded horse to
his haunches, and in a brief space control his
movement, that springing muscle has but a light
weight to control; the backward paddle soon
changes the course of the steamer, but this huge
engine, with its rather rash than roll, ponderous,
powerful, in such earnest in its motion that it must
have great space of change, how shall this stop
before it shall crush out of all form of life, that
feeble child? The play with the soil is of such
importance that the little one does not hear the
roar of the wheels, or if it does, it is a child of a
cabin proximate to the rail, and the sound is a
familiar one—it continues its play, and nearer and
nearer, by an advance that is the very step of death,
the train comes towards it. Mr. GLINN deter-
mined, in a tested accuracy of judgment, that his train
could not stop in time! What if it was checked,
and the speed, that was measuring the mile by
every few minutes, diminished, the death blow by
the swifter would be the more merciful—destruc-
tion was certain—the little one must meet the force
that would crush it from the record of the living,
and its play went on as if it were at his mother's feet.

This brave man read the realities of the scene in
an instant. He left his bar! the fireman's heart
forgot to beat; as for the passengers, they were
acting out the every-day scenes of a common-place,
peaceable journey; perhaps the checked speed
caused somebody to lay down his newspaper; of
the intense scene without he knew nothing.

He left his bar, and walking firmly over the top
of the locomotive, over the hot boiler, past the
smoke stack, he climbed over the front and down
the step-like frame work of the pilot, and grasping
that with a desperate strength, he leaned over the
bars of iron seemed to glide dizzily away beneath
him, and now the struggle for the child was one
between death and bravery, and, as ever in this
mortal time, the King of Terrors seemed to have
all the might in his skeleton hand. He leaned
over! he reached forward! and at that instant, at
that period of time, (moment is too long a word to
express this), as the cruel edge of the pilot was
about to crush the little one, he, not the locomotive,
struck the child; if ever there was a bold love
touch this was one; and the perilled laid between
the tial and on the fast train darts. Then down
went the brakes, the strong arm of the brakeman
strained their wheel levers to crowd the delaying
surface against the speed; then passengers aroused
to find the train coming to a pause, while neither
station nor tank was near; then this brave man
trod his locomotive top back again, and, as soon as
the power of the advance could be subdued, jump-
ed from his iron step and ran down the road, the
wonder was that agitated limb could move so fast,
and there—there was the child, living, unharmed,
not a bone broken, not quite recovered from its
astonishment at the life-giving blow which had
turned aside the dart of death.

Restored to its parents, who thronged around its
deliverer, the little one, too young to realize that
it had quivered on, over the very verge of another
world, was taken home, Mr. GLINN returned to his
engine, and the rolling locomotive careered to its
grand progress with not a stain of blood upon its
burnished metal.

And is not the record of the deed of the highest
order of bravery, the courage that saves life?
SENTINEL, in New York Courier and Enquirer.

No man's religion ever survives his morals.

Wit and Humor.

INSTRUCTION TO A JURY.—"If the jury believe,
from the evidence, that the plaintiff and defendant
were partners in the grocery, and that the plain-
tiff bought out the defendant, and gave his note
for the interest, and the defendant paid for the
note by believing to the plaintiff a cow, which he
warranted 'not breachy,' and the warranty was
broken by reason of the breachiness of the cow,
and he drove the cow back and tendered her to
the defendant, but the defendant refused to re-
ceive her, and the plaintiff took her home again,
and put a heavy yoke or poke upon her, to prevent
her from jumping the fence, and by reason of the
yoke or poke broke her neck and died; and if the
jury further believe that the defendant's interest in
the grocery was worth anything, the plaintiff's
note was worthless, and the cow good for nothing,
either for milk or beef, then the jury must find out
themselves how they will decide the case; for the
court, if it understands itself, and it thinks it does,
don't know how such a case should be decided."

How NEW CALEDONIA WAS SETTLED.—The fol-
lowing rhymes are afloat in the Canadian press,
and are considered apt and pointed:

THE TEMPTATION.

New Caledonia's governor unto himself said he—
"Great stories told of heaps of gold will settle this
country;

For there be hosts of jolly greens who never stop to
think—
Who blindly swallow every hook that is hid in printer's
ink."

THE RESULT.

Fall thirty thousand brave men to Fraser river run,
And find that Yankee-Doodle-de is Yankee-Doodle done

THE BEST MIRROR.—"A pretty pair of eyes are
the best mirrors to shave by," said Mr. Allsease,
the other day to an old foggy bachelor.

"Why, humph! yes, to be sure," replied the old
bunx; "and I can tell you little more—many a
man has been shaved by them!"

VERY DEAR.—When you pay for your coat
double its value, why is it like your wife? Kase
it is very dear. "Humph!" says an old bachelor,
"very dear, indeed!"

MR. D.—sat a long time very attentive, musing
upon a cane-bottomed chair. At length he said:
"I wonder what fellow took the trouble to find all
them ar holes, and to put the straws round them?"

The best way to strengthen a good resolution is
to act it out yourself. If you resolve to repair an
old fence, it strengthens the resolution and fence
too to commence at once.

A man remarked the other day, with a very grave
countenance, that "however prudent and virtuous
widows might be, he had seen many a widow-err."

WHY are women like bees? Because the younger
the sweeter.

Corner for the Young.

For Moore's Rural New-Yorker
BIBLICAL ENIGMA.

I AM composed of 11 letters.
My 1, 8, 7, 10, 4, 5 was a son of Japhet, from whom
the Muscovites are supposed to be descendants.
My 2, 3, 6 was a descendant of Aaron and high
priest of Israel.
My 3, 10, 2, 11 was a vegetable, much used for food
by the Israelites while in Egypt.
My 4, 5, 10, 8, 7, 2 was a common article of food
among the Jews, and is used now by nearly all
nations of the present day.
My 5, 8, 3, 3 is a word often used in the Bible, but
of various meanings.
My 6, 7, 5, 6 is a word used by the prophet Hosea,
meaning "my husband."
My 7, 5, 2, 4, 5, 10, 1 was one of the most ancient
cities of Canaan.
My 8, 1, 6, 1, 7 was a warlike nation of gigantic
size, but were driven out by the Moabites, who
took possession of their country.
My 9, 2, 3, 6, 3, 10, 5 was a licentious woman, of the
Valley of Sorek, in the tribe of Judah, that
brought death to one of leaders of Israel.
My 10, 3, 6, 1, 8, 3, 10, 4, 5 was a nation of Bethle-
hem which sojourned in the land of Moab
and died there.
My 11, 2, 9, 10, 7, 5 was a city of Naphtali and the
residence of Barak.
My whole was an ancient king of Canaan, of
whom but little is known. His genealogy is mere
supposition.

telle, Nellie, and Maggie, Ovid, N. Y.
Answer to Miscellaneous Enigma:—Mr. John
Plowhandle.
Answer to Geometrical Problem:—190.2.

A BEAUTIFUL THOUGHT.—When engineers would
bridge a stream they often carry over at first but
a single cord. With that, next they stretch a wire
across. Then strand is added to strand, until a
foundation is laid for planks; and now the bold
engineer finds a safe footway, and walks from side
to side. So God takes from us some golden-
threaded pleasure, and stretches it hence into
heaven. Then he takes a child, and then a friend.
Thus he bridges death, and teaches the thoughts of
the most timid to find their way hither and thither
between the shores.

AMERICAN STOCK JOURNAL,
for 1869.

A MONTHLY PAPER of 32 large octavo pages, devoted ex-
clusively to the subject of Stock Trading. It is the ONLY
PAPER OF THE KIND PUBLISHED IN THE UNITED
STATES, and the topics treated are of deeply interesting to every
owner of a domestic animal, whether living in the town or country.
The Volume will commence with the first of January, 1869, and
the number will be sent promptly on the first of each month.
It will be printed on fine clear paper, with entirely new type, and each
number will be illustrated with "Views of Animals, in the best style of
Art. Our motto is: A GOOD PAPER, A LARGE CIRCULA-
TION, AND A SMALL PRICE, INVARIABLY IN AD-
VANCE.

TERMS:

Single Copies one year, ... \$1 00
Six Copies one year, ... 5 00
Clubs of Ten, (each one year), ... 10 00
Clubs of Twenty or more Copies, one year, ... 17 50 cts. each.
An extra copy to the person sending us 10 or more names at
50 cents each.
Specimen Copies, Prospectuses, and Posters sent gratis to all who
will send us their names and get up clubs of subscribers.
All orders should be addressed to the "AMERICAN STOCK
JOURNAL," No. 140 Fulton St., New York City.

THE NEW YORK OBSERVER,
The Largest Newspaper in the World.

NATIONAL, CONSERVATIVE, RELIGIOUS,
Belonging to no Party in Politics and no Sect in Religion.

EDITED by a Corps of Clergymen and Laymen of large experi-
ence, having the most eminent Writers of the day among its
regular contributors, and a Foreign Correspondence unrivaled.

FAMILY NEWSPAPER

that can be made, published on a large double sheet, so that it may
be separated, making

TWO DISTINCT PAPERS,

each paper in itself. No other newspaper is made upon this plan.
The READER sheet contains a full report of all the News of the
Day; a vast amount of miscellaneous reading; poetry and prose; an
AGRICULTURAL page, conducted by a practical and educated agricul-
turalist; a COMMERCE page, edited by a gentleman distinguished for
his acquaintance with the financial world—giving the latest re-
ports of the MONEY, PRODUCE, and CATTLE MARKETS, BANK
BROKERS, &c.; a MISCELLANEOUS department, embracing scientific,
literary, and artistic matter, with tales, anecdotes, biography, travels,
questions and answers, for the instruction and amusement of the
family and social circle.

The RELIGIOUS paper is filled with the choicest original and select-
ed matter in every department of Christian Literature; making a
delightful Sabbath companion, and furnishing a volume of interest-
ing and instructive reading every week. The best and most accom-
plished Clergymen, Presbyters and Professors in our Colleges and
Seminaries, constantly contribute to its pages. One of its chief fea-
tures of attraction is a Summary of Intelligence from

ALL RELIGIOUS DENOMINATIONS;

a feature peculiar to the Observer, and highly valued by Christians
who wish to know what is doing in other communities than their own.
The grand object of the NEW YORK OBSERVER is to promote
"peace on earth and good-will among men." For this end it seeks
to advance all those principles which make the Union of our
States more firm and permanent; it cultivates harmony and good
feeling among all denominations of Christians; and is a fearless
defender of the rights of all men, under the Constitution of the United
States and the Word of God.

In its Editorial discussion, its foreign and domestic correspond-
ence, the vigor and beauty of its original contributions and the ex-
tractions of its several departments in science, literature, art, agri-
culture, and commerce, the NEW YORK OBSERVER is determined
not to be surpassed by any newspaper in the United States.
Resisting radicalism in Church and State, promoting revivals of
pure religion and every wholesome moral reform on Scriptural and
rational principles, discarding and opposing all schemes, humbugs,
fanaticism, and every scheme of infidelity, socialism, and vice, the
NEW YORK OBSERVER designs to be a safeguard of Union, law, and
order, a champion of truth and righteousness in the earth.
It is the CHEAPEST newspaper of its class that is published. Both
the secular and religious papers are sold for five cents and fifty cents
in advance. Two families reading it taking it, as many do, will each
get a complete newspaper for \$1.20!!

PROPOSALS FOR SOLICITING SUBSCRIBERS.

To any who will obtain new subscribers for us, we will pay the
following liberal commissions.—For five new subscribers paying in
advance, fifty cents each; for more than five, ten cents for each
subsequent five, for ten or more, one dollar each. We will send a
copy of our Bible Atlas, with colored maps, on paper of large size
and best quality, to each new subscriber, on the receipt of his name
and payment for one year.
If you cannot give personal attention to this work, will you show
this advertisement to some clergyman or layman who will take an in-
terest in it, to whom we will give the commissions mentioned above.
We will send specimen copies of our papers to all who send us
their names and addresses, and we will be glad to hear from you, im-
mediately, as we desire to offer the paper at once to every family in the United States.

THE MASTER-SPIRIT OF THE AGE.

THE PUBLIC AND PRIVATE HISTORY

OF

NAPOLEON THE THIRD,

With Biographical Notices of his most distinguished
Ministers, Generals and Favorites.

BY SAMUEL M. SMUCKER, A. M.,
Author of "Court and Reform of Catherine II.," "Nicholas I., Emperor
of Russia," "Life of Alexander Hamilton," &c., &c., &c.

THIS interesting and valuable work is embellished with Splendid
Steel Plates, done by Mr. SARAZIN, in his best style, including

THE EMPEROR, THE EMPRESS,

QUEEN HORTENSE,

AND THE

COUNTESS CASTiglione.

The work contains over 400 pages of closely printed matter, and
has been prepared with much care from authentic sources, and fur-
nishes a large amount of information in reference to the

EMPEROR OF THE FRENCH.

HIS COURT,

AND

France under the Second Empire.

Which is entirely new to American readers. This work is the only one,
either in English or French, which boldly and accurately describes

THE REAL CHARACTER,

THE PRIVATE MORALS,

THE PUBLIC POLICY, of

NAPOLEON THE THIRD.

Copies sent by mail on receipt of the price, \$1.25.

J. W. BRADLEY, Publisher,
48 North Fourth Street, Philadelphia.

N. B.—We want active and energetic men in all parts of the United
States, as Agents for this and other Popular Works, to whom we will
pay the largest commission. Our list includes all the best WORKS
OF T. S. ARTHUR; also, "DR. LIVINGSTONE'S TRAVELS
AND ADVENTURES IN AFRICA," "SMUCKER'S LINK
OF DR. RANK," &c. Send for our list, which is sent free.

Wooden Water Pipe.

THIS PIPE is made of pine scantling, each section 8 feet long.
The usual size is 3 1/2 inches square with a bore of 1 1/2 inches.
The ends are jointed so that when laid down the entire course is
water-tight.

MOORE'S RURAL NEW-YORKER,

Agricultural, Literary and Family Newspaper.

CONDUCTED BY D. D. T. MOORE,

WITH AN ABLE CORPS OF ASSISTANT EDITORS.

THE RURAL NEW-YORKER is designed to be unsurpassed in Value, Purity, Usefulness and Variety of Contents, and unique and beautiful in Appearance. Its Conductor devotes his personal attention to the supervision of its various departments, and earnestly labors to render the RURAL an eminently Reliable Guide on the important Practical, Scientific and other Subjects intimately connected with the business of those whose interests it so judiciously advocates. It embraces more Agricultural, Horticultural, Scientific, Educational, Literary and News Matter, interspersed with appropriate and beautiful Engravings, than any other Journal—rendering it the most complete AGRICULTURAL, LITERARY AND FAMILY JOURNAL in America.

All communications, and business letters, should be addressed to D. D. T. MOORE, Rochester, N. Y. For Terms and other particulars, see last page.

Rural New-Yorker.

DISEASES OF CATTLE.—BLACK QUARTER.

EDS. RURAL:—Being a young farmer, I have not had the experience of those whose lives have been spent in the service, and I would like to say a word in relation to a disease that is now prevailing among the calves in this vicinity. Having lost three from the effects of it, I, as well as many others, would be very thankful for any light relating to its prevention or cure. The early symptoms I have never observed, as the animals were prostrate, and sometimes dead when first discovered. The first one I lost was taken in the shoulder, which swelled, seemingly, as full as the skin could hold, and spread from that to various parts of the body, as I found, on taking off its hide. As soon as I discovered it, I separated the others from it. The rest, to all appearances, were as well as usual at noon the same day, but the next morning found one of them dead. This was apparently attacked in the head, as his head and neck were swelled the most, and the swelling extended along each side of the back-bone to the tail. There were some spots on the shoulders and sides also. The other was well and hearty at night, and in the morning helpless and nearly dead—affected similarly to the second. On skinning them, the flesh in the diseased places was black and jelly-like, adhering tightly to the skin, and looking as though the creature had been beaten to death. One of my neighbors has lost two by the same disease—one of them was affected in the bowels, as they were found black upon examination. I have heard of a number more that have lost calves and yearlings in the same manner. One peculiarity of this disease is, it never attacks a poor calf—only the best are subject to it; and another is, that, as far as my observation extends, it never attacks cattle over two years old, and seldom over one year old. Now, as I am a subscriber to your valuable paper, I have taken the liberty to state the case to you, hoping that you, or some of your correspondents, may know a remedy, and give the desired information through the RURAL.—E. E. REYNOLDS, Canastota, N. Y.

MISSISS. EDS.—Can you, or any of your numerous readers, give any information through the RURAL concerning a disease which prevails here among the cattle, and a remedy therefor. It makes its first appearance in the legs—the animals get lame, and the legs soon become so swollen they cannot stand or walk—and, generally, from the time they lie down, do not live more than from four to eight hours. In the first stage of the disease, by rubbing the hand over the part affected, it appears as if there was froth under the skin, and when they die this part is mortified, while other parts are as natural as can be expected of a beast dying of any disease. The disease is not confined to either fore or hind legs.

The above is a sketch of the disease as it prevails here among the cattle—particularly in last spring calves. Any information concerning the disease and remedy will be good news in this vicinity.—J. M. ECHO, Armstrong Co., Penn., 1858.

In the treatment of diseases as afflicting the crowning work of creation, there are two systems in vogue—termed "New" and "Old School." The lesser emanations of Divine Power seem to be similarly blessed,—not quite that, however,—provided for, and a battle, intense in its warfare, is raging. In our article upon Murrain, as published in the RURAL of last week, we gave the two modes of medication, and in speaking of the particular form of ailment called out by our New York and Pennsylvania correspondent, above, our readers will have better opportunity to observe how it is that "doctors disagree." Our position is not that of an umpire in the fray,—we give the various forms, and those who have need can experiment. Each system has its favorites, and each, doubtless, has proved itself equal to the demands made upon it.

Every year a disease, virulent in its nature and speedy in its termination, carries off thousands of cattle, and from these characteristics it may be termed Inflammatory Fever. Each district in which the ailment makes its appearance has a peculiar term or appellation, and it is thus called black-quarter, joint murrain, quarter evil, &c., although it may not, at any one time exhibit all the symptoms of either of these complaints.

In the inquiry of Mr. REYNOLDS we find:—"One peculiarity of this disease is, it never attacks a poor calf—only the best are subject to it," &c. Youatt remarks that cattle of all descriptions and ages are occasionally subject to inflammatory fever; but young stock, and those that are thriving most rapidly,

are its chief victims. So aware is the proprietor of young Short-horn cattle of this, that while he is determined to take full advantage of their peculiar faculty for arriving at early maturity, by turning them on more luxuriant pasture than prudence would dictate, he endeavors to guard himself by periodical bleeding, or by the insertion of setons in the dewlap of all his yearlings. This disease is sometimes epidemic, that is, the cattle of a certain district have been pushed on too rapidly; they have a lurking inflammation about them, or they have a tendency to it; and by-and-bye comes some change or state of the atmosphere which acts upon this inflammatory predisposition, and the disease runs through the district.

The premonitory systems of inflammatory fevers are few. Many times the first intimations to the owner will be finding the animal with neck extended; the head, as near as can be, in a horizontal position; eyes protruding and red; muzzle dry; nostrils expanded; breath hot; mouth partly open; tongue enlarged; pulse full, hard, and from 60 to 70; breathing quickened and laborious; flanks heaving violently, and a low peculiar moan being made by the animal. Sometimes the senses of the animal are not affected, but generally there is a degree of unconsciousness; he will not move for hours; when compelled to do so, staggers—the staggering is principally confined to the hind limbs—rumination has ceased, and the appetite is quite gone. At length the animal lies down—it is more of a fall than a voluntary movement—gets up again almost immediately; soon drops again; debility rapidly increases, and death soon closes the scene.

In some instances—in fact in a majority of cases—where inflammatory fever has set in, and the disease has had early treatment, the patient seems to rally, and, if we may so speak, the nature of the disease changes—some of the symptoms appear from which the variety of names we have mentioned derive their origin. Lameness sets in—a seeming paralysis of the joints; the animal can hardly move at all, and we have quarter evil—joint murrain. This is not considered an unfavorable symptom, as the disease may be leaving the vital parts for those of less consequence. If the animal gains strength we may have some hope of conquering. The loins and back need care now lest they become peculiarly tender and sore—one of the most to be dreaded symptoms. When swellings occur about the shoulders, back or loins, and between the skin and flesh carbonic acid gas is evolved by decomposition, we have a still worse case. Worse even than this is the appearance of hard, scurfy patches of what seems to be dead skin. This is a dry gangrene, and it is the commencement of a sloughing process, extensive and inconceivably rapid. When the animal arrives at this stage Black Quarter, in all its fearfulness, is the dreadful malady. Ulcers soon appear and spread to the whole body; the urine, which had before been high-colored, becomes dark and bloody, and the solid droppings are streaked with blood. In this state of putridity Youatt claims that the animal may yet be saved, and gives the mode of treatment as follows:

"The first and most important step is copious bleeding. As much blood must be taken as the animal will bear to lose, and the stream must flow on until the beast staggers or threatens to fall. Here, more than in any other disease, there must be no foolish directions about quantities. As much blood must be taken away as can be got; for it is only by bold depletory measures that a malady can be subdued that runs its course so rapidly.

Purging must immediately follow. Epsom salts are here, as in most inflammatory diseases, the best purgative. A pound and a half dissolved in water or gruel, and poured down the throat as gently as possible, should be the first dose; and no aromatic should accompany it. If this does not operate in the course of six hours, another pound should be given; and, after that, half-pound doses every six hours until the effect is produced.

At the expiration of the first six hours the patient should be carefully examined. Is the pulse slower, softer? If not, he must be bled a second time, and until the circulation is once more affected. If the animal be somewhat better, yet not to the extent that could be wished, the practitioner would be warranted in bleeding again, provided the sinking and fluttering of the pulse does not indicate the commencement of debility.

If the pulse be a little quieted, and purging has taken place, and the animal is somewhat more himself, the treatment should be followed up by diligent exhibition of sedative medicines. A drachm and a half of digitalis, and one drachm of emetic tartar, and half an ounce of nitre, should be given three times every day; and setons inserted in the dewlap. Those of black hellebore-root are the best, as producing the quickest and the most extensive inflammation.

The bowels having been opened, recourse should be had once more to the pulse. If it indicate any degree of fever, as it sometimes will, (for the apparent debility is not always the consequence of exhaustion, but of vascular congestion,) the physi-

cian must be continued, but the constitution would perhaps be too weak for the direct sedative medicine. On the other hand, however, no tonic medicine must be given. If, however, the pulse be weak, wavering, irregular, giving sufficient intimation that the fever has passed, and debility succeeded, recourse may be had to tonic medicines. The tonics, however, which in such cases would be beneficial to cattle, are very few. Mineral tonics have rarely produced any satisfactory result—but in gentian, calomel, and ginger, the diseases of cattle find almost everything to be wished. They may be given three times every day, in doses of a drachm each of the two first, and half a drachm of the last. They will be more effectual in these moderate doses than in the overwhelming quantities in which some administer them, and in which they oppress and cause nausea, rather than stimulate and give appetite. They should always be given in gruel, with half a pint or even a pint of sound ale.

The practitioner may possibly be called in after ulcers have broken out, and the sloughing process has commenced; there must be no bleeding then; the vitality of the system has received a sufficient shock, and various parts of it are actually decomposing; but physio is necessary, with a double dose of the aromatic, in order to rouse the energies of the digestive system, and to get rid of much offensive and dangerous matter collected in the intestinal canal. Epsom salts will here also constitute the best purgative.

The ulcers should be carefully and thoroughly washed several times every day with a solution of the chloride of lime,—1 oz. of the powder to 1 gallon of water. The ulcers about the muzzle, mouth and throat, should be treated in a similar manner; and a pint of the solution may be horned down twice in the course of the first day.

Prevention of this malady is the only cure worth notice. A piece of short or inferior keep should be reserved as a digesting place, in which the cattle may be occasionally turned to empty and exercise themselves. Those observed to advance very fast may be bled monthly for several months; but occasional purges of alternative medicines would prevent those diseases which seem to take their rise in over-repletion and accumulation, and are far better than bleeding.

This disease differs materially in its symptoms in different districts, and in the same district at different times. The difficulty lies in the other diseases with which the inflammatory fever is combined—sometimes one, and sometimes another, assuming a prominent character; and while they all generally follow inflammatory fever, yet some of them occasionally precede it.

In some places, the first symptoms are those of quarter-ill. The cattle are seized first in one quarter, and then in the other. The skin puffs up, and the crackling noise is heard almost from the beginning. The disease is usually fatal when it assumes this form."

Come we now to the other system. Among the causes for Black Quarter, as laid down by Dr. DARR, are the blood letting and scouring systems. In opposition thereto the Dr. remarks:—"In the inflammatory stage, we are told, 'The first and most important step is copious bleeding. As much blood must be taken as the animal will bear to lose; and the stream must flow on until the beast staggers or threatens to fall. Here, more than in any other disease, there must be no foolish directions about quantities. [The heroic practice!] As much blood must be taken away as can be got; for it is only by the bold and persevering use of the lancet that a malady can be subdued that runs its course so rapidly.' From these directions we are led to suppose that there are some hopes of bleeding the animal to life; for the author above quoted seems to entertain no apprehension of bleeding the animal to death. Mr. PRICHAL and other veterinary writers, inform us that 'an animal will lose about one-fifth part of its weight of blood before it dies; though a less quantity may so far debilitate the vital powers, as to be, though less suddenly, equally fatal.' The latter portion of the sentence means simply this; that if the bleeding does not give the animal its quietus on the spot, it will produce black quarter, gangrene, &c., which will be 'equally fatal.' In the latter stages of the disease now under consideration, and, indeed, in dry gangrene, there is a tendency to the complete destruction of life to the parts involved; hence our remedies should be in harmony with the vital operations. We should relax, stimulate, and cleanse the 'whole system, and arouse every part to healthy action, by the aid of vapor, injections, stimulating applications, poultices of charcoal and castileum, to parts where there is danger of rapid mortification; lastly, stimulating drinks to vitalize the blood, which only requires distribution, instead of abstraction."

In reference to the scouring system (purging,) as a cause of mortification, we leave the reader to form his own views, after reading the following:—"After abstracting as much blood as can be got

INDIA, OR AFRICAN GOOSE.

away, purging must immediately follow. A pound and a half of Epsom salts dissolved in water or gruel, and poured down the throat as gently as possible, should be our first dose. If this does not operate in the course of six hours, another pound should be given; and after that, half pound doses every six hours until the effect is produced!!!"

Treatment.—As the natural tendency of these maladies is the complete destruction of life to all parts of the organization, efforts must be made to depurate the whole animal, and arouse every part to healthy action. The indications of cure, according to the reformed principles, are, to relax spasm, as in locked-jaw, stoppages of the bladder or intestines, obstructed surfaces, &c.; to contract and strengthen weak and relaxed organs, as in general or local debility, diarrhoea, scouring, lampas, &c.; to stimulate inactive parts, as in black leg, joint murrain, quarter ill, foot rot; to equalize the circulation, and distribute the blood to the external surface and extremities, as in congestions; to furnish the animal with sufficient nutriment for its growth and development. Antiseptics may be freely used in the following form:—Powdered bayberry bark, 2 oz.; charcoal, 6 oz.; cayenne, 1 teaspoonful; slippery elm, 1 oz. Add boiling water sufficient to make it of the consistence of thin gruel.

All sores and foul ulcers may be washed with Pyroligneous acid, 1 oz.; water, 1 gill.

Another.—Chloride of lime, 1 ounce; water 1 pint.

Still Another.—Chloride of soda, 1 ounce; water 6 ounces.

The affected parts should be often bathed with one of these washes. If the disease is not arrested by these means, repeat them, and put the animal on a diet of flour gruel.

PRACTICAL FARM NOTES.

WE continue our PRACTICAL NOTES, though crowded into an uncomfortably small space. Bremen and African Geese.

In the RURAL of the 20th ult., we referred a correspondent to EBEN WIGHT, of Boston, for reliable information in regard to Bremen Geese, their value, and the source from which they could be obtained pure. Mr. WIGHT, with his usual kindness and promptitude, furnishes us the following facts, not only in regard to the Embden or Bremen Geese, but the African, a cross between which he considers, as shown by the facts stated, far more prolific than either pure. We give an engraving, above, of the African, the largest of the goose family.

MISSISS. EDS.—In your paper of the 20th ult., Mr. OSCAR ADAMS asks where he can obtain Bremen Geese. The largest and best pair I have ever seen, is owned by WM. G. LEWIS, Framingham, Mass. Col. SAMUEL JACQUES, Somerville, (P. O. address Boston,) Mass., was the first to import these geese into this country, and has now in his possession one of the original pair, imported about thirty years ago. Mr. A. can probably procure the pure breed from either of the above named persons. But I would advise Mr. A. to act on hints which follow, being an extract from an article furnished by me for our State Report in 1857, under the head of India, or African Geese.

This is of the largest varieties of recent introduction, and proves much more prolific than the

Bremen, or any common goose seen about the country; it is a stately-looking goose, of gray upper plumage, with white under the body, and any one not having a large dew-lap, or pouch, should be rejected, as less likely of attaining to the largest size. A few years since a person had a gander of this breed weighing twenty-six pounds. Having lost his mate, the owner coupled him with a Bremen goose. Of this progeny, or cross, he saved two of the geese, and bred these two back to the same gander. These two geese laid more than one hundred and fifty eggs, the first year of laying. In 1856 they came into my possession. One of the two geese I disposed of to a friend, which has proved exceedingly prolific; while that retained by me has laid equally well, and in 1856 gave me sixty-seven eggs; in 1857, sixty-five eggs; in 1858, between sixty and seventy eggs. So fast as she gave me five eggs, they were placed under a hen, and each hen was allowed to bring them up.

I have now on hand of the second growth, a large flock of the young—all the progeny of this one goose for this year. If well cared for, they will dress to weigh from fifteen to twenty pounds each. The Bremen geese which I formerly bred, would give me about nine eggs each, and I would advise Mr. ADAMS to obtain one of each breed if he wishes to breed for profit—none are better for the table than the cross. EBEN WIGHT, Dedham, Mass., 1858.

Pitching Hay with Horse Power.

THE only mode of pitching hay with horse power, that we know of, is the following, which

Figure 1.

has been described in the RURAL, and other Agricultural Journals. To make the subject plain, we give engravings from THOMAS' Farm Implements.

Figure 2.

Figure one shows the operation quite perfectly. The head of the fork (fig. 2) is about 28 inches long, and is fitted with steel prongs 20 inches long. The rope attached at a pass over the pulley above,

by which the fork, after being thrust into the hay, is lifted by the strength of the horse working just without the barn door. It is kept level by means of the rope, & until the fork is high enough to unload, when this rope is slackened, and the hay deposited. The man on the mow can give any direction to the hay he pleases while it remains suspended. The horse is backed, and the operation repeated. The arrangement is cheap, and with it six tons have been pitched twenty feet high in an hour.

Prairie No-Patent Fence.

A cheap fence for the prairie districts, one that is simple in construction, safe and durable, and without any patent restrictions, so that any farmer can build it, is a great desideratum. We have already given several, and now a correspondent in Minnesota sends us the following:

Messrs. Eds.:—An odd number of the *RURAL*, containing a cut of Watson's no patent fence, having fallen into my hands, reminds me to send you a design which I have had on hand some time. I have not seen one like it, but its prototype exists on our prairies, in the shape of two stakes fastened together by a strong nail, like a saw-buck; two rails are nailed on instead of boards, a rider laid in the "buck," and the stakes driven slightly into the ground.

FIG. 2. FIG. 1.

My drawing explains itself; a piece of 4-inch scantling, with a piece 2 by 4 notched into it, and a nail to keep them from spreading, forms a "bent," which is a good substitute for a post. As there is no post in the ground, it has a broad base, and the boards present the edge to the wind. (Fig. 1.)

These "bents" can be framed in the winter (for level ground) within doors. They may be used in combination with Mr. Watson's portable fence, (Fig. 2.) by mortising the large piece to receive the ends of the rails, and slipping in a key by the side to keep them in place.

A. W. A.
Sakopee, Min., 1868.

SORGHUM SUCCESSFUL.

COL. MOORE:—I give you herewith my experience with the "Chinese Sugar Cane," for the past two years.

Last year (1857), from one-fourth acre planted I got no syrup worthy of the name. I had about eighty gallons of juice pressed out, and tried to boil it into syrup, but from some cause, (either premature freezing before cutting, or want of knowledge and skill in the process of manufacture,) it was an entire failure, so far as making syrup was concerned. I fed out the remainder to my stock, and was satisfied from the result that it would pay to raise it for feeding cattle, horses and hogs.

Last Spring I procured one-fourth pound of seed of E. D. HALLOCK, and planted it on one-eighth of an acre, same time, (May 25th), as corn, and same distance apart (four feet—I think four feet one way and two the other would be as well). As I planted it for feeding alone, without expecting to get any syrup, I did not strip off the leaves or take out the suckers, but let all stand through several hard frosts, until the 17th of this month (November), when I cut it up, stripped off the leaves, and selected 4,300 of the largest canes, from which Mr. HIRAM ROBBINS, of Penfield, manufactured forty-three gallons of syrup as per sample sent herewith, which is thought to be equal to maple molasses in flavor, and for cooking, every way superior. This gives an average of 100 canes to a gallon, and 344 gallons per acre. If the smaller canes had been ground, or had the cane been planted thicker, the yield per acre would, of course, have been greater. Probably 400 gallons per acre would not be too high an estimate upon good land, with good culture. Some of the seed was apparently well matured.

The cost of cultivation is no greater than that of corn, and the leaves and suckers, if removed in season, will nearly pay in fodder the whole cost of cultivation. The principal expense just now is the manufacture into syrup. But, if it costs one-half the syrup, as in my case, it pays well enough. To speak within bounds, an acre will produce 300 gallons, which, at four shillings, (although now worth six), is one hundred and fifty dollars. The expense of converting into syrup may be \$50, or one-third now, (it will be less hereafter,) and \$100 per acre may be assumed as the product, and nearly all profit, too, of an acre, with less labor than almost any other crop.

Please bear in mind that I am reasoning on facts, the main one of which, viz., the twenty gallon keg in my cellar, is put to a daily test, which has done away with all previous skepticism on my part, and with my own experience as a basis, I believe it will soon become an article of general cultivation, and that every one, who has so much land as is covered by the shade of a good sized maple tree, can, if the soil is adapted to it, raise syrup sufficient for the supply of an ordinary sized family. It is a strong argument also against the cultivation of tobacco, that the same land will produce an article of general necessity and agreeable flavor with less labor and equal or greater profit.

As a matter of public or political economy, its advantages are too evident to need mention now. It might be well enough to suggest, however, to those orators who made such powerful pleas for the prospective benefits of the "Great Cable," that this is a matter of immediate, practical, pecuniary benefit to all, North and South, rich and poor, the farmer and mechanic as well as the merchant; and should the orator aforesaid take the stump and labor for it as for the success of the said cable, and should all interested take hold of the matter in earnest, if there were no processions or celebrations in its honor, we might be able, by the time Lt. MANN hears the ticking of the clock in Greenwich Observatory, to telegraph to "Queen Vic" that hereafter, among her contributions

from the Universal Yankee Nation, she might expect to have some sweetening from the States, bordering upon her own provinces, as well as the Gulf of Mexico.

WILLARD HODGES.

Rochester, N. Y., Nov., 25, 1858.

This sample of molasses accompanying above is very superior—fully sustaining the recommendation, and tending to prove Sorghum a success.—Ed.

BEES AND BEE-HIVES.

MY EXPERIENCE.—NO. VIII.

THERE are only two classes of bee-keepers who ought to use the non-swarming hives, viz., those who are so situated that they cannot possibly take charge of their swarms, and those who have so many that all cannot be kept in one place. The object of such hives is to obtain the surplus honey and have but little trouble with the bees. COLTON, and some others, pretend they have given us a non-swarm, merely by giving room in an extra number of boxes; but experience proves that they are not to be depended on as such in all cases. It is said also, that bees "never swarm until the hive is full," which is a great mistake. After much experimenting, it appears that the only way to prevent swarming and be safe, is to give the colony room to extend their combs freely in several directions where it is perfectly dark. But all the surplus obtained in this way, is not in the best order for market, as it is necessary to take it in pieces. Any practical plan that would prevent swarming, and induce the bees to store all their surplus in neat glass boxes, such as I now send to market, would be worth to me ten times the cost of any patent. On this point I have found nothing satisfactory.

Any person that can possibly take care of their swarms, before they decide on keeping bees without swarming, should contrast the profits with the other method. Suppose you start with one as a non-swarm, and call it worth five dollars at the beginning, at the end of ten years it is worth no more—very likely not as much. The chances of failing short of that time we will not take into the account. We might get annually, say five dollars worth of surplus—in ten years fifty dollars. Now suppose you start with a swarming hive that will cast a swarm annually, and make one dollar's worth of surplus and the swarm do the same; (about one-third of the average in good seasons,)—the second year there are two to do this, the next year four—take this rate for ten years, and we have 512 colonies, either of them worth as much as the non-swarm—these colonies with the surplus amounts to some thirty-five hundred dollars, to contrast with the non-swarm's product of fifty-five! I do not offer this as an actual result, but as an illustration. Persons supposing that the bee is a long-lived insect, cannot understand how a colony of bees is no better at the end of ten years, than at the end of one; but such is the fact. Bees never increase after the first year! that is, they are a full swarm then. Although they may rear thousands! as many die off as are matured by the end of the year, and they have gained nothing. This is too easily tested and proved, to be disputed.

M. QUINCY.

St. Johnsville, Mont. Co., N. Y., 1859.

FAST HUSKERS, AGAIN.

D. DICKINSON, of Rose, husked out of the stock seventy-five bushels in ten hours, being seven and a half bushels per hour.

The Sherman boys (alluded to in a late *RURAL*) husked at the rate of 83 bushels per hour on the hill. They will try next season and you may expect 150 bushels to be a day's work.

One farmer husked, out of the stock, 40 bushels, put it in wagon and offered his neighbor all he could husk more than that. His neighbor called next day and husked 80 bushels on shares to the halves. J. B. R. has good corn, 165 bushels to the acre, his men husked 66, 53 and 41 bushels per day out of the stock. Other farmers claim 25, 30 and 35 bushels to be a day's work. There seems to be a wide margin in the opinion of farmers as to what is a day's work in husking. As corn is the great crop of this country, the actual cost of its cultivation should be better understood. My opinion is that 33 bushels out of the stock and put in a wagon, stalks well bound and set up, is a day's work, and that three cents a bushel is a fair price for husking—man board himself.

SLOW HUSKERS, ALSO.—Fearing you may think that all the people down this way are fast, I must give you the answers to some inquiries made while the excitement was up. One farmer had 25 day's work's done husking, and had husked less than 200 bushels ears; another farmer relates that he found two of his men seated at one stock "yarning finely," one carrying a bundle of stalks, the other a pumpkin from stock to stock for seats, supposed they husked 15 bushels each. The *RURAL*, coming in with the fast husking just in time, gave quite an increase in speed—seats were entirely laid aside, and only one man to a stock—it helped out.

Next fall keep one column open for the huskers, as the most corn per acre and the fastest huskers are to take the prize. E. N. THOMAS.
Lyons, N. Y., 1858.

PACKING BUTTER FOR WINTER USE.

Messrs. Eds.:—In reading the *RURAL*, I observe that a subscriber wishes to know the best method of packing butter for winter, so I will give my mode, which I have practiced for fifteen years or more, and I never have strong butter when thus packed, although I will not say it is the best.

The first requisites are, good healthy cows and good feed and water for them, plenty of salt, milk vessels often and thoroughly cleaned, and the milk strained, skimmed, and churned at the right time and temperature. Use good salt, and thoroughly work your butter, but not too much, and then pack in clean stone vessels. If they have been used for packing the previous winter, cleanse by throwing on three or four handfuls of nice ashes, then filling with hot water, and letting it stand two or three days; rinse, wash, and scald again with clean water, and let stand until you think all the ley is removed, then rinse once more, rub with good salt, and pack the butter as solid as possible. After it is packed, wet a clean white linen or cotton cloth, cover closely, and melt sufficient butter to saturate and cover it the thickness of a heavy sheet of paper—more if you like,

After the melted butter has become cold, have another clean wet cloth ready, and lay it on, make sufficient brine to cover (with good salt)—let it stand a few minutes until the scum has all arisen, lightly blow it off, then pour it on the butter, and set in a cool place, where it will not come in contact with fish, flesh, or vegetables of any kind. When you commence using, the cloth is easily removed by pulling it up on one side, to give room for cutting out. After removing what is needed, lay it on again, tightly as possible, until more is wanted. Don't let that "careless girl" leave it open once, and don't do it yourself. After using the cloth, fill the vessel with hot water, and put in the cloth that is saturated with the butter, rinse and ring out—letting the vessel stand until cold, then skim off the butter, and all is saved for crullers, beefsteak, or ginger-snaps, then wash and clean your cloths for another winter, as economy and care is the mother of riches.

E. B.

Bradford, Steuben Co., N. Y., 1858.

BREAKING STEERS.

EDS. *RURAL*:—W. R. A., of Wampsville, asks three questions which I will endeavor to answer. Though I have broke steers, I have never attempted to break my pen for the types, therefore you will please "fix it" if worth publishing.

To break steers, gentleness and patience must have "their perfect work." Take one at a time, on a barn floor or small yard, and tame them by great gentleness, feeding from the hand, &c. Then commence driving, very gently, an hour each day, till they obey perfectly. Drive singly and otherwise till they go well. Before yoking, hang the bows on their necks till they are familiar with them. Then put on the yoke and take it off, learning them to stand perfectly quiet during the operation. The too common practice of yoking steers when commencing to break them, and whipping and yelling at them,—they running and being run after alternately,—ought to be dispensed with. Steers should be learned to obey by speaking to them. This can be done only by constant drilling, always making them do as told. Cattle, to become handy at all kinds of work, must have experience. Do not expect steers to become oxen at once. Like "Trainers," they may perform their evolutions well, but for field fighting they must learn the "tag of war."

To make a yoke is a very simple thing. I should take basswood, season under cover, and make by a well shaped yoke to look at. The patent yokes are highly recommended for ease to cattle.

The best way to fasten cattle is to have the stalls partitioned separately, with bars, (gates are the most convenient,) allowing them sufficient liberty to lie down with ease. Make their racks so they cannot waste their fodder, and bed them with dry straw, leaves or sawdust. Feed well and your cattle will show their keeping, and your amount of manure will be largely increased. J. LYMAN.
Jordanville, N. Y., 1858.

SACCHARINE MARKET REPORTS.

EDS. *RURAL*:—A good many of your friends have fallen into the habit—a very natural one I admit—of saying pretty things of the *RURAL*, and it is in no capricious spirit that I, on the other hand, venture diffidently to suggest one improvement for the coming volume. Now that "hundreds of acres" of sorghum have been harvested, and almost endless quantities of delicious syrup manufactured, and also sugar, these products must of course soon be crowding on the market; and the suggestion is that you so enlarge the range of your "Price Current" for the future, as to include both of these delectable articles. Should Mr. R. B. of Pretty Prairie, Ind., keep on squeezing through "a cloth strainer" all winter, he may by spring squeeze down the price of both materially, and we desire a "corrected market report" each week, that we may hail the first omens of this auspicious result. These necessary articles of domestic use are a heavy tax upon the house-keeper, and we beg of our friend to keep on squeezing, and never give it up! Whether the "gentle means" first used, or the more severe "pressure" afterwards resorted to, was simple hand power, our friend does not say; if it was, let me suggest to him as better for the purpose, a simple implement used by the "good lady" in finishing her lard and tallow scraps—to wit, a couple of strips of lath board three feet long and three inches wide, fastened together at one end by a strip of leather, the other ends whittled round to hold on by; then place a sack of the contrary stuff between, apply the strength of an ordinary sorghum grower, and "thick, gummy substances" will find they are in a "tight place," and will be glad to get out. Of course, it is understood that there is no charge for this hint. W. B. F.
Prattsburgh, N. Y., 1858.

TO CURE POLL EVIL.—I perceive in a late issue of the *RURAL*, a temporary cure for Poll Evil—I will give a permanent one, which has been tried in many cases, of every stage, and if judiciously attended to a short time, is universally successful:—One oz. of spirits hartshorn; 1 oz. spirits camphor; 1 oz. spirits turpentine; 1 oz. laudanum; 1 oz. sweet oil—or in this proportion. The whole put in a bottle, the oil and hartshorn first, and it matters not which of the others succeed. Shake before using. If applied previous to breaking rub well with the hand, if after, pour a portion on the affected part once a day. I cured one of my own (the most revolting case I ever saw), which remained sound some 12 or 15 years, or during the life of the animal.—A. G. C., Sparta, Canada West.

PUMPKIN MEAL FOR HOGS.—We clip the following from an exchange:—"Pumpkin meal, formed of dried pumpkin by grinding, is one of the most valuable articles known for feeding swine. The pumpkin should be cut in thin slices, and thoroughly dried by exposure in clear weather to the rays of the sun. The more thoroughly the process of drying is effected, the more valuable will be the article for this purpose. When thoroughly dried, pumpkin is ground as easily as Indian corn or any other grain. The proper method of using it is to mix it into a thin batter, or mush, seasoned with a small quantity of salt, and fed warm. Swine are very fond of it. Squashes may be used in the same way, as may also carrots and parsnips, both of which, when sliced and dried, may be easily converted into meal."

INQUIRIES AND ANSWERS.

RACK AND FEEDING TROUGH.—Will J. H. B. please describe, and, if necessary, illustrate his combined Rack and Feeding Trough for sheep, in such a manner that we can build after his plan, and thus accommodate—MANY READERS, Farmington, Mich., 1858.

WHITE GUINEA FOWLS—SHEEP RACKS.—Can you, or some of your numerous correspondents inform me through the *RURAL*, who has White Guinea Fowls for sale? A description of a good rack for foddering sheep in, would also oblige at least one of your subscribers.—W. S. G., Fairfield, Mich., 1858.

REMARKS.—In the next number we will give some plans for Sheep Racks.

POUDRETTE.—(D. H. A., South Sodus).—You cannot afford to buy Poudrette and use it on your land. We have known several use it, and none found it to pay. If you cannot make your land rich enough with stable manure, and clover, and must purchase a concentrated article, the cheapest thing you can get is the best Peruvian Guano.

AGRICULTURAL COLLEGE.—(L. S., Cherrytree, Pa.).—We don't know, at present, of any Agricultural College that we can recommend a young man to attend. Improve every moment in studying the natural sciences, particularly Chemistry and Geology. Engage for a few years with the best practical farmer you can find, watch closely how he does things, and why; trace the effect to its cause; keep your eyes open and your thinking apparatus in constant exercise; read the best books and papers you can get on practical and scientific agriculture; try experiments to prove or disprove the theories you read, and you will make a farmer, even though you never enter an agricultural college.

DRAIN TILE.—I would like to make the inquiry through the *RURAL*, what the cost of draining tile is in Western New York? We have commenced draining in this section, and have to procure our tile from Albany, at from \$15 to \$25 dollars per thousand, including freight, which we think rather high. Would you have the kindness to inform me through your paper what they can be purchased for at the Western factories?—and what they would cost delivered at Rexfords Flats? I commenced laying tile some five years since, and have prosecuted the business as fast as my means would allow, and would like to procure the tiles somewhat cheaper if I could, although I am convinced that it is profitable to drain, even at the prices we have to pay at Albany. I might give you some of my experience in draining, but perhaps it would not be interesting to many of your readers, as more able and experienced men have given your readers and the public a more correct account of the cost and profits than I could do.—A SUBSCRIBER, Burnt Hills, 1858.

REMARKS.—We know of no subject of more importance to American farmers, at present, than that of draining. We have had plenty of theory and now we want the facts—the experience of farmers who have drained their land. On this subject we cannot have too much light, and we hope our correspondent will give us his experience. Those who have tile-drained can speak with authority, and no fears or doubts can withstand the stubborn facts. We believe two-inch tile pipes can be had at the factories in Western New York for ten dollars per thousand. Why don't the manufacturers advertise their tile, and give prices?—or is the demand greater than the supply? We have several inquiries similar to the above, and have no means of ascertaining the facts but by writing to the proprietors of the different tile works.

CONDENSED CORRESPONDENCE.

LEMONS IN RENNET.—Cut the lemons in slices, taking out the seeds. The juice does not affect the curd.—AMELIA, Cayuga, N. Y., 1858.

TO PRESERVE ONION SETS.—Noticing the inquiry in the *RURAL* of November 6th, how to preserve onion sets, I send you one method which we have practiced for many years with entire success. We gather the sets as soon as they are ripe, and spread them in the chamber, letting them remain there until the approach of freezing weather, when we remove them to the cellar and stow them away in kegs or boxes.—SALISBURY, Platte, Erie Co., Penn., 1858.

EXPERIMENT WITH POTATOES.—As I see a number of articles on potato raising, I thought I would give my experience. Last spring I was short of seed potatoes. I cut the seed end of the large potatoes to plant, and saved the large ones to eat. In finishing my patch I got out of seed, and to make my patch full, I took the butt ends and planted two rows. When I came to dig, the two rows planted with the butt ends yielded twice as many to the row as those planted with the seed end. I planted the pieces of each kind whole in the hill, without cutting. Some men say cut the potato in one or two eyes to the piece, but I think that too small to support the vine in dry weather. The large potato with the seed end out off gives few stalks, while the large potato gives plenty of sap to support the crop through a drouth. The seed end sends up too many stalks in a clump. Will others try the experiment?—WM. F., Wellsboro, Pa., 1858.

THE TIME FOR SAVING SEED POTATOES.—Every observing man knows when digging potatoes (if he digs his own), that he frequently finds a hill of nice tubers, all good size, and no small ones among them. Such potatoes are the best for seed. Take them and lay them aside, and you will soon get two or three bushels. The next spring plant them whole, one in a hill, and the ensuing fall pursue the same course again. Repeat the process for four years and you will then have a superior quality of potatoes. I have pursued this course for three years, and am well satisfied of the result. If every potato cultivator would do this, we should soon cease to hear them complaining of small potatoes. I am in favor of planting whole potatoes. I believe cutting has degenerated the plant.—S. M. JOHNSON, Monroe Co., Mich., 1858.

CORN CROP OF KANSAS.—The Leavenworth City Herald says that the corn crop of Kansas this year is very abundant. It is now selling in Leavenworth City for twenty-five cents a bushel, and declining; while in some localities it is a perfect drug in the market.

Rural Miscellany.

THE WOOL GROWER AND STOCK REGISTER, formerly published by us, was merged in the *RURAL NEW-YORKER* some two years ago. We repeat this for the information of all interested, and the especial reason that we are yet in frequent receipt of subscription money, and requests for specimens of said journal. Though tolerably well sustained, the *W. G. & S. R.* was discontinued because many of its subscribers preferred the *RURAL*, on sight and examination. Perhaps we made a mistake in sending specimens of the *RURAL* to its readers, but if so it is too late to repent, and we are satisfied with the result. The *W. G. & S. R.* is not the only monthly that has had to succumb to the more varied, interesting and progressive weeklies.

CREDIT.—We are reminded that the note on the first page of the same number of the *RURAL* headed "Experiments with Wheat," is ascribed from the *Country Gentleman*.—*Country Gentleman* of Dec. 2d.

The article referred to is less than twenty lines, and was found by us in a country exchange, and as it contained the results of important experiments, and just filled the column, we used it for this purpose, without knowing that it had appeared in our Albany cotemporary. But, really, the claim to proprietorship in this article is very small, and is simply that the *Country Gentleman* was the first to copy it from an English Journal. Now, if our over-particular friend was in the habit of seeing as we are, column after column of original articles—the children of his brain—sent forth every week by a score of journals, as their offspring, he would never think of claiming the rights of paternity for this little stranger, which he only introduced from a foreign land. In the "same number" of the *Country Gentleman*, in which we find this complaint, we also find an item of our own without credit,—or rather, we would say one to which we have as much right as that paper has to the one claimed, and it was probably obtained in the same way as we obtained ours—but, really, this is too small business to talk about.

BUCKWHEAT AS FOOD.—M. ISIDORE PIERRE has recently been making some investigations on buckwheat, from which is condensed the following interesting results:—Buckwheat cakes are equal to pure white bread as regards the phosphates or bone-making material, and nitrogenous principles which they contain, and are superior to bread in fatty matters. The general yield of buckwheat when cooked is about three times the weight of the flour used, showing that such flour will retain forty to forty-one per cent. of water. Between different batches of ground buckwheat is a great dissimilarity of composition—one batch containing nearly seventeen times as much nitrogen, twenty-five times the amount of phosphates, and a hundred and fifteen times as much fatty matter, as another. The bran is the richest portion of the buckwheat, but cannot be digested by weak stomachs. The finest qualities of buckwheat flour, and the white mill dust especially, are very suitable for children and persons in delicate health, while the coarser varieties require a strong stomach and much exercise for their perfect digestion.

"FAST CORN HUSKING."—In reference to the paragraph in the *RURAL* of Nov. 6, on this subject, a correspondent at Spring Prairie, Wis., writes:—"We think the 'Boy' who husked one hundred and three-fourths bushels between 6 A. M. and 6 P. M., 'will have to try again.' P. W. CHASE, of this town, husked, on the 19th of October last, one hundred and ten and a half bushels of ears of corn. Stalks on the hills and topped; corn from two rows thrown into one. He husked the corn in 10 hours and 15 minutes; the balance of the 12 hours was spent in getting his meals, which he took about 30 rods from his work. The corn was measured up the day after it was husked."

PREMIUM STEAM PLOW.—The judges appointed to decide as to the merits of the steam plow tried at the Royal Agricultural Show at Chester, England, have unanimously awarded the prize of £500 to Mr. Fowler. It is beyond question, they say, that Mr. Fowler's machine is able to turn over the soil in an efficient manner at a saving, as compared with horse labor, of, on light land, 24 to 25 per cent; on heavy land 25 to 30 per cent; and in trenching, 80 to 85 per cent; while the soil in all cases is left in a far more desirable condition, and better adapted for all the purposes of husbandry.

CHINESE SUGAR CANE.—The Chicago Journal of Agriculture and Prairie Farmer, says:—"We see it estimated that Iowa alone has saved herself a million of dollars, that would have gone abroad to buy sugar and molasses, but for the cultivation of this year. Illinois will have saved nearly as much.—Wisconsin and Indiana something. Next year, most of the Western States will export, and we may look for improved quality in these staples, for they are to become such."

A NEW CATTLE DISEASE IN CALIFORNIA.—The Los Angeles Vineyard, of Oct. 28th, says that a disease has made its appearance among the cattle of El Monte, in that county, called the "mad itch." Its first appearance is an eruption about the lips, which causes so intense an itching that the animal rubs the affected parts until the skin is destroyed. The rupture spreads rapidly over the head and neck, killing the animal in a few days.

WHEAT AND CORN IN OHIO.—According to the Assessor's returns from all the counties in the State, the number of acres planted, and the number of bushels gathered, of wheat and corn, in 1857, was as follows:—Wheat 1,823,147 acres, and 25,397,614 bushels. Corn 2,254,425 acres, and 83,565,186 bushels.

INCREASE OF WOOL IN OHIO.—The Cleveland Wool Grower for the present month, says:—"We have at some expense obtained a tabular statement of the number of sheep in this State, showing 3,308,503 head, which at three pounds per head, is 9,926,409 pounds, an increase over last year of ten per cent., or about a million pounds of wool."

Orchard and Garden.

HORTICULTURAL DEPARTMENT FOR 1859.

THE year is fast drawing to a close. Two more numbers complete the present volume of the RURAL, and as the last number will be so occupied with a full and well-prepared index, fitting the work for binding, that we shall have little space in that for Horticultural matter, we purpose at the present time to say a few words on the past and the future. On the first, we need say but little to those who have been our friends and readers the present or past years. As our subscribers, however, are now active in exhibiting their papers to their friends as specimens, for the purpose of inducing them to subscribe, and as we have every day scores, and sometimes hundreds of applications for copies, from those who design to become constant readers of our Journal, should an inspection prove the good name it has gained to be well founded, a few words to them will not be out of place.

Although but about one-eighth of the RURAL is devoted to Horticultural subjects, it contains each year enough reading on this important matter, to make two books of about 500 pages, and which would cost far more than this Journal. No weekly paper gives as much information in regard to the culture of fruit, vegetables, and flowers, and we confidently challenge comparison with either of the exclusively Horticultural Journals. Our illustrations are more numerous, and better than those of any other paper in America, while our reports of the proceedings of the Horticultural and Pomological Societies, held in all parts of the country, are acknowledged to be unequalled for correctness and completeness.

We have endeavored to make our instructions as plain and practicable as possible, avoiding almost all scientific and technical terms. We have tried to convey valuable information in a manner that could not be misunderstood. We have labored to teach the learner facts and modes of culture—important principles—essential to success, and have ever avoided nice points more curious than useful. No Journal has labored more zealously or successfully in the field of Horticultural literature the present year, than the RURAL. We have manfully defended the right, while we have fearlessly condemned the wrong. In doing so we may have made enemies, but we know that the true and good approve our course; but higher and above all, we have an approving conscience, for we have "extinguished nothing, nor set down aught in malice."

For the future, we have only to say that we shall be unceasing in our efforts to make this department of the RURAL equal, if not superior to anything in the country as the AMATEUR'S GUIDE and the HORTICULTURIST'S ASSISTANT. While usefulness will be our aim and motto, we shall not forget, occasionally, to introduce things both new and strange. We shall enter the New Year with fresh zeal, and talk more fluently than ever of foliage, fruit and flowers. We have no reason to suppose that these are farworn words to any considerable number of our readers; on the contrary we have every reason to believe, that all who have perused this department during the present year feel well repaid, and will not only continue the fast friends of the RURAL, the coming, and for many years, but will exert themselves manfully to add to the number of our readers, and thus aid us in our efforts to increase knowledge and improve taste—the love of the beautiful and true—until our country houses shall become truly rural homes, the lily spring up where once grew the thorn and briar, waste hearts as well as waste places be made glad, and the desert blossom as the rose.

CLAY SOIL, AGAIN.—Wishing to obtain some information concerning the best method of preparing a clay soil for a garden, I thought I would make some inquiries through your excellent paper. I have lately plowed the ground, and now what next? Would rotten sawdust be good, mixed with manure, charcoal, and black mellow earth? This is the way I have thought of fixing it; and, also, would rotten sawdust be good to put around fruit trees?—A SUBSCRIBER, Olena, Huron Co., Ohio, 1858.

REMARKS.—The plan proposed of adding mellow earth, charcoal, manure, &c., is good. Anything that will make such a soil more friable will be found of advantage, but good drainage is the best ameliorator of a stiff, impervious clay. No one, until he has tried it, or seen its effects, can realize how completely the character of such a soil is changed by thorough drainage. A gentleman in the eastern part of this county planted an orchard in the spring of 1856, in clay, and nearly all the trees died before the next spring. Some thought the trees were poor, others thought they had been badly drowned. During the summer of 1857 the ground was well drained with tile. Indeed, the work was so well done that many were not slow in expressing the opinion that the owner was burying money. In the fall of '57, trees were planted, and during the last summer every one made a fine growth. Half-rotten sawdust, if put on thick, makes a very good mulching.

SAVING TREES DURING WINTER, &c.—(O. P. M., Clinton, Mo.)—It is too late, we fear for the information desired, to be of any advantage, but we gave the same some weeks since, in answer to another inquirer. We would lay the roots of trees in a trench, say two feet deep, in a dry place, and cover with earth. If "laid in" in a slanting direction, and covered pretty well up the trunks with soil, a little evergreen brush or straw may be thrown over the tops, and all will be safe. On no subject is information more sought or needed than the varieties of apples suited to the soil, climate, and markets of the West and South-west. On this point we will reply before long.

VINEYARDS ON LONG ISLAND.—At the meeting of the Farmers Club at New York, Mr. PROVOST, of Williamsburg, was examined relative to his very extraordinary vineyard there. He produced on one acre fifteen hundred gallons of wine in one season. He makes one gallon of brandy out of five gallons of his wine. He gave samples, which were tasted. The brandy was pronounced pure and excellent, and was last year worth eight dollars a gallon. The wine, therefore, can make 300 gallons of brandy, worth \$2,400.

THE SWAAR APPLE.

We offer no apology for acceding to the request of a correspondent and presenting to our readers a drawing and description of the celebrated American Apple, the SWAAR. It is recommended for general cultivation by the American Pomological Society, by Mr. BARNY, as "unimpeachable" for Western New York, who also names it among "twenty choice garden varieties." F. R. ELLIOTT, author of the "Fruit Grower's Guide," names it as one of the best three winter varieties for Ohio, and we notice it is spoken well of for the West by some of the writers for the Agricultural papers. At the last North-Western Pomological Convention, held at Chicago, on a vote of 22 members, for the best 12 varieties, the Swaar received 7 votes. We copy Mr. DOWNING's description.

"This is a truly noble American fruit, produced by the Dutch settlers on the Hudson, near Esopus, and so termed from its unusual weight, this word, in the Low Dutch, meaning heavy. It requires a

deep, rich, sandy loam to bring it to perfection, and in its native soils, we have seen it twelve inches in circumference, and of a deep, golden yellow color. It is one of the finest flavored apples in America, and deserves extensive cultivation in all favorable positions, though it does not succeed well in damp or cold soils.

Fruit large, regularly formed, roundish. Skin greenish-yellow when first gathered, but when entirely ripe, of a fine, deep gold color, dotted with numerous distinct brown specks, and sometimes faintly marbled with gray russet on the side, and round the stalk. Stalk slender, three-fourths of an inch long, inserted in a very round cavity. Sometimes this cavity is partially closed. Calyx small, greenish, set in a shallow basin, scarcely plaited. Flesh yellowish, fine grained, tender, with an exceedingly rich, aromatic flavor, and a spicy smell. Core small. The tree bears fair crops, and the fruit is in season from December to March."

ORCHARDING IN ILLINOIS.

FRUIT is a total failure here this season. It is true, we had a good supply of strawberries, gooseberries and currants, but apples and pears are few, and terribly "aquirmy" at that. Our old orchards present a blighted and sickly appearance. The leaves are curled and pallid. They blossomed profusely in the spring, but they make no show of fruit now. This stunted, unhealthy aspect is widespread, tending to discourage and unsettle many of our most persevering Pomologists. Some attribute this incipient decay of western orchards to the cold of the last three winters deadening and denuding the sap, while some censure the mighty deluges of rain which have fallen on our prairies this season. Whatever the cause, no Horticulturist can but notice an injurious something consuming our fairest orchards. Young orchards of three and four years' progress look healthy and vigorous, but those of eight to sixteen years appear consumed and cauterized. There seems to be a stage of six years in which young trees thrive admirably at the West, and when the trunks obtain the magnitude of a stove-pipe they begin to kill at the crotch, or yield to some pestiferous cause, and pine.

Seedling trees do better than any kind of root-grafted stocks. They always bear bountifully, and the winter's cold affects them but slightly. It is now the settled experience of most nurserymen here, that seedling orchards grafted in the top are the ones most profitable and permanent in the prairie country. Examine the roots of a young four year old seedling, and the best specimen of a nursery-grown tree. The one has ten thousand ramifying, fibrous suckers drinking in the elements of growth and development from a large space around, while the other has two or three naked prongs barely sufficient to enable it to retain its position. It is strange that beginners will not gather wisdom from experience.

Were I asked by a young Western Horticulturist what trees to select for an orchard, I would reply, plant seedlings every time. The third year top-graft them by cutting away one half the top, finish the following year. In this way you secure a straight, robust tree, while you avoid the crooked trunks of some varieties, like the *Pamouse*, and are sure of good feeders at the root besides. Take up your own trees if you have to journey one hundred miles for them. I can save two years in exercising a little patience and care in removing a tree. Never set out in the fall, especially if you live in Illinois. Experience has taught me most emphatically that spring is the best time to plant.

Location is almost one-half. Orchards planted upon a level prairie, unsheltered, will not thrive.—The highest rise of ground on your farm is the best site for an orchard. In every case a belt of cotton wood or other fast growing forest trees should be planted around the place. In four years this forest hedge will do much in breaking off unfavorable winds. Again: the cold is less intense upon our high lime-stone ridges than down on the low, flat prairie. The difference I have ascertained to be seven degrees, where the common observer would suppose the reign of winter was the most tyrannical. I had peach trees that survived even to the terminus of their top branches on the highest and most exposed acclivity of my premises, while those down in the low lands were chilled to destruction. The air is more rarified than in the hollows and basins. I preserved an apricot those two coldest winters, all exposed on the top of a high hill, by cutting back the growth in September, while no artifice could have prevented it in the valley below. Our lime-stone ridges require no draining. These are best calculated for orchard

culture and graperies. The chances of being winter-killed are incalculably less than in a low ravine though sheltered by hills. I have much to say, Mr. Editor, on varieties, method of culture and new theories, but I forbear for the present.

REMARKS.—We spent a portion of one summer, (1856) in Illinois, and we then saw whole orchards of bearing apple trees that had been entirely destroyed by the cold of the previous winter. This was the case with both grafted trees and seedlings. We have published several articles from practical men in Illinois, stating that while some varieties endure the rigors of the climate, and others prove too tender, seedlings as a general thing are not more hardy than grafted trees—indeed, that a proper selection of grafted trees would be far safer than the same number of seedlings. The experience of our correspondent is different. The truth on this question, and on all others, we desire to lay before our readers, and therefore call upon the fruit growers of Illinois to give us the facts.—From a number of facts we may be able to draw useful and correct conclusions, but inferences from a single instance of success or failure are generally unreliable.

ILLUSTRATED ANNUAL REGISTER OF RURAL AFFAIRS.—This valuable little work for 1859 is before us. It has been published by LUTHER TUCKER & SON, of Albany, for five years, and the matter and drawings being prepared by our good friend J. J. THOMAS, it is altogether superfluous for us to say that in all respects it is got up with the greatest skill and ability. It is a gem of the kind, and there is nothing published in this country that can compare with it in beauty or value. Price 25 cents.—In a late number we quoted from this annual a paragraph of eleven lines, giving the varieties of pears that proved hardy, tender, &c., in Stephenson county, Illinois, for which we should have given it credit, and we did not observe the omission until our attention was called to it. Although we see our articles copied every day without this act of justice, we never appropriate the labors of others designedly without full and fair acknowledgment. We think the publisher or compiler was a little at fault in so arranging the article that the necessity for credit in this case was not very apparent.

IS THE NEW ROCHELLE OR LAWTON BLACKBERRY SOFT?—A celebrated grower of grapes enumerated many instances in which he had found the New Rochelle Blackberry sour and worthless, and asserted that many people grew them for market, but would not use them in their families. Is this true with yourselves, or your subscribers? The truth should be known, as hundreds of dollars are being invested in their culture.—AN ANXIOUS SUBSCRIBER, Westchester, Co., N. Y., 1858.

REMARKS.—The New Rochelle Blackberry is very sour, and unpleasant to the taste unless picked just at the right time. It turns black before ripening, and those who imagine all the black berries are ripe find, on testing them, that they have made a sad mistake. When fully ripe they are of very good flavor, and then must be picked immediately, or they drop off.

GRAFTING PEARS ON QUINCE, &c.—(Subscriber, Barrington, N. Y.)—There is no object in endeavoring to grow the quince on pear stocks, as the quince roots are more easily obtained than pear roots. Standard pears should be planted from 20 to 25 feet apart. We will name a dozen good sorts, which you would do well to plant. Osband's Summer, Bartlett, White Doyenne, (if it does not crack in your locality.) Louise-Bonne de Jersey, Beurre Diez, Vicar of Winkfield, Lawrence, Easter Beurre.

NORTHERN MUSCADINE GRAPE.

MESSRS. EDS.—From a late No. of the RURAL, I see cultivators seem to differ widely with regard to the merits of the Northern Muscadine Grape. There are but few questions which have only one side; and, after duly considering the opinions, all must come to the conclusion that this has two. Now, gentlemen, I will give this contested grape a fair trial, on all sides, let the result be what it will, and if I fall in this attempt I am open to conviction.—So, we will now proceed to trial.

The Northern Muscadine is brought to the stand with two or three serious charges against its character. First, At sundry times and in divers places it has been accused with imparting a certain odoriferous perfume, peculiar to its nature. It cannot be denied but what this charge is true—that is, after the grape is dead ripe. Still, it may be objectionable to some under any circumstances; therefore, it is but fair to admit that it is a musky grape when dead ripe, but is not objectionable generally before.

Second. It is charged that the berries do not adhere to the stem after they are ripe. This is too true, but is almost entirely removed by age. Still, this is a considerable of an objection.

Third, and the last objection is, they will not keep a great length of time. This is a little exaggerated, as they may be kept a proper length of time in cotton, but not half as long as the *Isabella* and some other varieties.

We have now taken a fair view of the darkest side of the question. Now, for the bright side.

First, Its hardness is a strong recommendation. In this northern climate it is as hardy as can be asked for.

Second. It is the earliest in ripening of any grape within my knowledge.

Third. Now, for the greatest recommendation of this grape. It is the best wine grape I have ever seen in this country; and if this grape had no other recommendation, I would cultivate it for its superior wine qualities alone. I will give \$25 for a single grape root which will produce a better wine than the Northern Muscadine.

Now, if I have not taken a fair view of the whole matter I hope some one will be just kind enough to do so. Don't be bashful, gentlemen.

Jackson, Wash. Co., N. Y., 1858. H. VALENTINE.

CURIOUS TO KNOW.—The editor of the RURAL NEW-YORKER (Nov. 13th), says, "day or two since," Mrs. M'KAY treated him to splendid *Isabella* grapes, &c., while on her way to Montreal to market. Some 3,000 lbs. (at 17 cents per pound,) yielding \$510—part of the product of less than half an acre of ground. What we wish to know of our cotemporary is, how grapes are kept in a good marketable condition so late as the 10th of November, in that latitude?—Montgomery Ledger, Pa.

REMARKS.—There is no difficulty in keeping grapes here until after New Year's. We have them now as good as when first picked from the vines, and better; for like pears, we think they mature after picking, if well kept. This is true, particularly of the *Clinton*, and other varieties that are rather too sharp when gathered. We allow the fruit to remain on the vines as long as safe, being careful to pick before frost; place them carefully in baskets, and allow them to remain in a cool, dry place for a week or so, then pack them in shallow boxes, either of wood or paste board, placing a piece of cotton batting at the bottom of the box, and a piece of newspaper between each layer of bunches. Cover with cotton, and place on the cover. It is not necessary that the box should be tight; indeed, a little air is of benefit. Keep them as cool as possible without freezing. We had forgotten to say that on packing away, we examined each bunch, and removed all green or bruised berries, and if any mildew is observed, brush it off with a soft brush. If Mrs. M'KAY pursues a plan any different or any better than this, we hope she will inform us.

TAN BARK FOR HOT-BEDS.—Will you, with your usual kindness, give a description or rule for making hot beds with tan bark? It is an article very plenty with us, while stable manure is rather scarce. Query.—how will we use the article that is plenty?—the scarce article we understand?—AN OLD CANADIAN SUBSCRIBER, Prescott, Nov. 25th, 1858.

REMARKS.—Tan bark is used in England for pine pits, and sometimes for hot beds. The English tan bark, which is used for this purpose, is from oak trees, and will generate and retain a moderate heat. The tan bark which is used in this country, being generally from the hemlock spruce, is entirely unsuited to the purpose of making hot-beds, alone. It can be, however, and is sometimes used where manure is scarce, in conjunction with stable manure, in this way.—Provide equal quantities of short stable manure and tan bark, and mix the two thoroughly together. If dry, moisten with water, and place the whole in a conical heap, for a few days, when a fine heat will be generated. The material is now ready for use, and can be formed into hot-beds in the usual way of making with stable manure.

DISEASED APPLE TREES.—I am one of your readers, and would like to inquire through your paper, the cause and remedy of a disease among my apple trees. I set out fifty apple trees ten years ago, and they had a fine growth; but last year, on some of them, the outward skin, or sun bark, dried up, and fell off, and the sap bark is pulverizing away. Last spring one tree died of it, and seven or eight are injured. The ground has been eight years under grass and clover. The soil is loamy about two feet deep and then clay.—A FARMER'S SON, Zealand, Mich., 1858.

REMARKS.—It is rather difficult to give advice in a case of disease without seeing the patient, unless the description of symptoms are full and plain. In this case we would advise our young friend to examine the trunks of all the trees, scrape off all the moss, and any other foreign substance, and remove all diseased bark with a knife, and then scrub them with a stiff brush and soft-soap. Break up the sod, and keep the soil well cultivated next summer, and if you can do so, give a dressing of lime or ashes. At any rate, give a good feeding of manure.

FRUIT GROWER'S MEETING.—The Annual Meeting of the Fruit Grower's Society of Western New York will be held at the Court House, in Rochester, on Wednesday, Jan. 6th, at 11 o'clock, A. M. The officers for the ensuing year will be elected, after which important questions pertaining to the interests of fruit culturists will be discussed.

Domestic Economy.

THE BREAD QUESTION, AGAIN.

EDS. RURAL.—I never had much confidence in matrimonial advertising, but if a body does take that course, I think there could be no more laudable motive than bidding for a wife who could make good bread and dumplings. NERUCHADNEZZAR's (for short we will call him NUCK,) fastidiousness shows the improvement in public sentiment since the days of his illustrious namesake who, being an original *ruralist*, never questioned about bread, but was content with a bite of good, sweet grass. Such a husband, no doubt, would be very convenient, for when he came home hungry, all a body would have to do, would be to turn him out—but I must acknowledge it would look more civilized if he insisted upon having a nicely spread table, covered with a snowy loaf, or a dish of making hot dumplings. And, as every step of advancement in science or art,—whether it be in smoking bread, or using steam, or electricity,—should meet with encouragement, I propose that the girls turn out, *en masse*, with specimens of bread for NUCK's inspection. Black eyes to bring corn bread, blue eyes wheat bread, grey eyes graham bread, &c.; and, girls, when you come, don't forget the dampings! Won't SYLVANUS' mouth water at the sight of the fair, white balls presented by the plump, rosy hands that moulded them? I may not be able (not because I can't make both, don't think,) to attend, but if either or both of the above mentioned gentlemen will call at our place, which is well known through the country as "Tamarac Swamp Farm," I pledge myself to give them something to cheer besides gum—especially SYLVANUS. I confess to a preference for this young gentleman, the reason of which perhaps you will understand when you see I subscribe myself—SYLVIA, Tamarac Swamp Farm, 1858.

MESSRS. EDS.—In looking over the Domestic Corner of a late RURAL, my eye very naturally rested upon what NERUCHADNEZZAR calls a golden opportunity for the girls. I neglected SYLVANUS, of Burlington, and wishing to atone for so doing, I write forthwith to NERUCHADNEZZAR, to inform him of the fact that I, though not yet twenty, can mix, make, and bake just as good, light, wholesome bread as he or any other granivorous animal may wish to taste. If he did not live Down East and I Out West, I would invite him to tomorrow—which is my baking-day to attest the truth of the statement here made. I presume he thinks, since the grass is hidden with snow, that he will trim his hair and nails and go to eating bread—if he can get any made to suit his taste. I am glad he has a soul above dampings, for I don't like them very well myself, especially the ones I make. The reason I did not send SYLVANUS any recipe (don't print this part,) was because my brothers call my boiled dumplings a good substitute for small cannon-balls, and thinking he might not relish this kind, I did not send him my mode for preparing them. But I fear I am trespassing on the RURAL's time and patience by making my first communication somewhat too long, so I will quit for the present.—HAGAN, Black Swamp, Ohio.

EDS. RURAL.—If NERUCHADNEZZAR wishes to see the lady that can make extraordinary good bread, please tell him to call and spend a few days with me. Fearing he cannot come, I will inform him how to make it. To six quarts of flour, half a cup of potato yeast; a little salt; mix with milk or water—if water, add a little lard when kneaded the second time—mix at night, and it will be ready to bake in the morning.

POTATO YEAST.—Take eight good sized potatoes, grate them; boil a handful of hops in one quart of water, strain, and pour over the potatoes while hot; when nearly cold, add a little yeast; a teaspoon of sugar; a tablespoon of salt; set in a warm place to rise; when light, put away in a stone jar, in the cellar. This will keep good six weeks in cool weather.—A YOUNG MEXICAN, Mexico, N. Y.

SYLVANUS HEARD FROM

Now, girls, see here. I want to be fair with you, but how am I to eat so many dumplings? If they are all as good as I believe they are, and the girls are as delicious and tempting as the dumplings—why—I have counted without my host. Verily, I confess to that degree of ignorance and unsophisticated simplicity that I never dreamed of there being but one way to make a dumpling, and, of course, but one to make it, and such an array of plump cheeks and rosy dumplings—or, I would say, rosy cheeks—ah! you see how it flatters my intellects—such an array—or, I mean, such a proof of the disinterested kindness and obliging disposition that dwells in the hearts of my countrywomen! What a libel on old bachelors—moping and smoking in dismal garrets when they might be feasting on the luxurious dumplings, sweetened with the ——. But I am following "the dreamer" off into dreamland. Girls, when I get all ready, I'll come out your way and take a look—perhaps incog—so you need not brush or slick up a bit, for I shall wish to see how you look in checked aprons and hands in the flour, and how you do lots of other things that belong to a house-keeper's duties. It is my intention to marry a real, bona fide, healthy, working girl—one who works, not to please this one or that one, but for the pure love of employment and from a desire to be useful—just as I believe you all do. And now, JENNY, and MOLLY, and ANNA, and AGNES, &c., &c., accept my thanks for your kindness, with a hope for further acquaintance in the "good time coming." SYLVANUS.

Bartown, N. Y., 1858.

LOAF CAKE.—I have found some excellent recipes in the column allotted to Domestic Economy, but not having seen any for Loaf Cake, will some of your many readers, that have one they know to be good, please send it through the RURAL, and oblige.—ANNA, North Chili, N. Y., 1858.

CORN BEEF.—To corn beef, my method is to cut it up and pack it in the barrel, and make a brine out of good rock salt, strong enough to bear up an egg, and pour on scalding hot.—R. G. B., Pultney, N. Y., 1858.

Ladies' Port-Folio.

Written for Moore's Rural New-Yorker.
THE FLOWER-LANGUAGE OF THE HEART.

BY AMANDA T. JONES.

THROUGH my heart's lone garden stealing,
Filled with memories of the past,
Mourned I, for the flowers of feeling
Withered at life's wintry blast.

"Once the lowly-bending Violet,
Like a spirit free from art,
With the sweet Wild-Roses flourished
In this garden of my heart.

"And the rosy Almond-blossoms,
Hope's sweet spell around them thrown,
Downward looked with smiling faces
On the dreamy Anemone.

"That was long ago in childhood;
But my eyes are full of tears,
When I muse upon the freshness
Of those forgotten years.

"O'er my heart, so light and merry,
Flow life's gleeful summer-hours;
But the days, deceitful, flattered
O'er by one my precious flowers.

"Yet one dainty thing I cherished,
Watching every bud unclose,
Till my heart was filled with fragrance
By this beautiful White Rose.

"'Twas a free heart's sweetest emblem—
Empress-flower of my youth—
'Twas an angel-form appeared
In the snowy garb of truth.

"But it faded—brown and dusky
Fell its withered leaves apart—
And there swept a fearful tempest
O'er this garden of my heart.

"Crimson rose-buds, just out-starting,
Blasted, and beside them grew
Sorrowful Adonis-blossoms,
And the sad, disdainful Rue."

Crowned with mocking, Thistle-flowers
Underneath the Judas-Tree—
Sighing for the sweet White Roses
That I never more might see—

Thus thro' my heart's garden stealing,
Filled with memories of the past,
Mourned I, for the flowers of feeling
Withered at life's wintry blast.

But there rose a starry blossom,
And its mystic language said—
"Look, despairing mortal, heavenward—
There are angels o'er thy head."

Upward in my sorrow glancing,
Praying for a swift release,
Came a snowy dove from Heaven
With the "Olive Branch of Peace."

Round my forehead angel-fingers
Twined the wreath with heavenly art—
And a holy presence lingers
In this garden of my heart.

GLEANINGS.—No. IV.

"I WANT you to understand, WINNIE"—and my mother thrust her bonneted head in at the door—"I want you to understand that the bread is in the oven."

"Very easy of comprehension, I am sure. But what have I to do with the bread's being in the oven? I am perfectly willing it should remain there."

A slight frown. "Well, I wish you to attend to the baking of that bread, as I'm going out. Now, don't burn it up, WINNIE!"
I think I laughed, notwithstanding this pathetic appeal. I could not help it. I had a slight presentiment that the bread would be burned. Another moment she was gone, the bread safe in the oven, and I so comfortably seated in my arm-chair, that I hardly think I would have changed my position if all the bread in the universe were in one vast conflagration. But I really did mean to attend to that bread.

What a snow-storm! I watched the pearly flakes—coagulating the while, something like this: What a pity folks can't live without eating. I positively think it is sad. However, "what must be, must be," and there's more truth than poetry in it, I imagine. Yet how much labor, expense, and care, would be abolished, could we subsist without—victuals. Now, there's mamma, walking out in this snow-storm, never heeding the beautiful flakes—so large and feathery—never minding the human figures passing and re-passing; but hurrying on, worrying all the time because "she's sure WINNIE will let the bread burn!"
(I wonder if it needs turning yet? I'll take it for granted that it don't.)

People hurry, and worry, and drudge—that is, most of them do—from "morn till dewy eve," with the grim demon Care, ever urging them on. Is it, I wonder, because they ever have before their eyes, the truth that there is "no work, nor device, nor knowledge in the grave" whither they are fast hastening? I wot not. For, if it were so, they would have thought less of secular affairs, and remembered mercy, faith, and judgment to come. I never believed in living a life of idleness, but I do think it is our duty to pause once in a while and bask in the sunshine—to stop now and then and gambol gaily on the green spots which dot our road-side. Now, if I were Mr. CARE MUCH, that bowed, anxious-looking man, I would look up my business, look, thoughts, and all, with my boxes and bales, and as I neared home, I would whistle "Begone, dull care!" or shout "Get thee behind me, Satan!" to the invisible spirit. Then I would surprise Mrs. CARE MUCH by being pleasant and sociable. Yes, I believe I would kiss her, and tell her she is the best little wife in the world. It would be a new scene in her life-drama, and I am sure Mrs. C. would like the change. Then I would have a regular game of romps with the children—those little ones who are almost afraid of the gloomy, taciturn man they call papa. I think Mr. CARE MUCH would feel like a "new creature."

And Mrs. CARE MUCH—what a pale, weary look she has. No need of it, whatever. A mere slave to domestic drudgery. All useless. I would care less for "creature comforts" and be more mindful of the souls of my family. I would not cook so much if I were her. I would have lighter, simpler food and fewer dishes. Perhaps husband would

frown and mutter, at first, but I would convince him that it was for his good as well as mine. It's my firm belief that what people eat, influences their thoughts and actions. Yes, there is many a short, unkind word concealed in that rich pie-crust—many a gloomy, weary feeling imbedded in masses of cake and floating in highly seasoned dishes.

Then, my domestic cares so much lightened, I would devote more time to husband and children. I would have an interesting book on hand, and, after supper, while he reclined on the sofa, I would read aloud to him, wooing his thoughts away from labor and care. I would tell the children stories; just such stories as I loved to hear when I was a child, and I would teach them of Heaven, and point out the way. In a short time I think Mr. CARE MUCH would be applying to the Legislature for a change of name.

Mamma at the door! Indignation and sorrow resting on her face—and a tin in each hand, filled with the blackened ruins of that bread. "I knew you would burn it, WIN—I felt sure of it. And now what shall I do?"

Dear me! if I had not been minding the affairs of Mr. and Mrs. CARE MUCH, I might have remembered my own. However, if it does them any good I shall not care for one baking of bread.
Rochester, Nov. 1858. WINNIE WILLIAM.

HOOPLOGY, AGAIN.

I CONFESS myself surprised that any sensible reader of our RURAL should be so firm a supporter of this hoop delusion, still I do not consider myself vanquished, and, as the lady thinks I have only ridiculed her favorite science, I am ready now to meet her, together with every other hooped lady in christendom, with no other weapon than plain, common sense, and, if I am not victorious, then success go with them. Her first plea is "heavy skirts." No one disputes their being injurious, but "common sense" asks, is a skirt which stands at an angle of forty-five degrees from the body, the remedy we need for this evil? A proper degree of heat is just as essential to health as the want of it, and how happens it that these hoops, which are so cool in summer, become so very warm in winter? With the Indian, I am ready to exclaim, "It must be an evil breath that blows both hot and cold." There is no sense in it—this is only one of the many excuses for this foolish fashion. It is very common to hear persons decant upon their merits, and say they shall always wear them, whatever change may come, but when the "fickle goddess" proclaims "thy days, oh, hoops, are ended!" the lady who still persists in wearing them will deserve a place in BARNUM'S Museum. There is not one who will have the moral courage to do it. She says, too, "she has never found them inconvenient in traveling." I, too, have traveled in company with hoop, and, if I ever found anything a nuisance, it is that. With the frogs in the old fable, I can say, "It may be sport for you who wear them, but it is death for us who are obliged to tolerate them." Here is common sense again—every hooped lady occupies sufficient room for two, and as such should pay extra fare for the trouble she makes. If you wish to get out of an omnibus, you must crowd through, each one looking as if she would annihilate you for troubling her hoops. It is the same everywhere, in the car, in the street—they are nuisances, nothing else. I do not wonder "penny editors" and "street rowdies" ridicule them, so does every person who has one particle of "common sense," at heart, if not by word. Who makes these fashions? Some of them are Parisian, and what greater stain upon us as American women than this aping of foreign styles? But all do not come from there, they are manufactured in our cities by Mademoiselles and Madams, who never even saw Paris, and we, so eager for new things, follow them, and dare not say a word. Wear hoops, not I! They are of no practical benefit to the female race—they are nothing but a gigantic humbug.
Coyuga, N. Y., 1858. ANELIA.

OUR MOTHER.

PEACE to her memory. She has gone. The heart that once beat so warmly—the voice that has so often gone up to God in prayer for us, is hushed, cold, silent in death. It is good to remember her as a friend—as a Christian friend—but oh, how dear to remember her as a kind and affectionate mother.

We are orphaned—not by every tie, but from a dear mother's sympathy and a mother's love. There is a void in our hearts—a loneliness we never before have realized. Grief softens our hearts, gives all worldly objects and worldly schemes a careless attention, and fits our "better natures" for an examination. She has left a quiet record. How sinful the wish to bring her back to these trying scenes—rather bless Him, who is merciful, and has taken the spirit to its reward. Death-bed scenes, the grave, and the absence of one beloved, will have their influence on the living—may it follow us to manhood and to "green old age," (should it be ours,) Spirit Mother. Be our Guardian Angel, for

Earthly ties are broken;
But as Heavenly bonds are dearer,
Our hearts will love to cherish
The fond memory of a "beacon light,"
Trimmed and kept by Angel hands.
Onondaga, N. Y., 1858. A.

THE cook, the housemaid, and the laundress are the pillars on which our domestic comfort rests. Without them, nothing is possible in family or individual life. The well-cooked dinner, the tidy room, the clean shirt, are the landmarks of true civilization. Below them all is barbarism.

SYMPATHY is much more catching than intelligence. Anybody can feel, but everybody cannot understand. Hence pity for a person brought into distress by his own acts, often outweighs all the conviction produced by a knowledge of his crimes.

WE cannot all of us be beautiful, but the pleasantness of a good-humored look is denied to none. We can all of us increase and strengthen the family affections and the delights of home.

Choice Miscellany.

DARE AND DO.

BY WILLIAM O. CAMERON.

UPWARD—onward! Fellow-workman;
Ours the battle-field of Life;
Ne'er a foot to foemen yielding,
Pressing closer midst the strife!
Forward! in the strength of manhood—
Forward! in the fire of youth—
Aim at something; ne'er surrender—
Arm thee in the mail of truth.

Though thy ways be strewn with dangers,
Summer rain-drops lay the dust;
Faith and hope are two-edged weapons
Which will ne'er belie thy trust.
Shrink not, though a host surround thee,
Onward! Duty's path pursue;
All who gild the page of story,
Knew these brave words—Dare and Do!

Miller was a rough stone-mason;
Shakespeare, Goldsmith, Keats, and Hood,
Franklin, Jerrold, Burns, and Gifford,
Had to toil as we for food.
Yes: these men, with minds majestic,
Sprang from ranks the rich call poor;
Cast a halo round brown labor;
Had to wrestle—fight—endure.

Forward, then; bright eyes are beams;
Fight, nor lose the Conqueror's Crown;
Stretch thy right hand—seize thy birthright—
Take it—wear it—thine own;
Slay the giants which beset thee;
Rise to manhood—glory—fame;
Take thy pen, and, in the volume
Of the gifted, write thy name.

ELDER BROTHER.

ELDER BROTHER! Is there in any language another name, besides the matchless one of "Mother," so hallowed as this? It expresses more than father, sister, child, and even more than husband, or wife. A father is something to be esteemed and revered; a sister is the kind playmate of your childhood, and the loving sympathizer in after years, but her woman's nature, so like your own, precludes the possibility of great variety in tastes and emotions. A wife is to be loved, fondled, and protected; concerning a husband—although you may love and respect him, and though you make his interests your own, you feel he is not part of your real self—none of the blood of your loved family courses through his veins, and the natural impulses of the heart are not the same. To a female there can be no relation so dear, so pure, as that of brother. He is fond and proud of his sister; for her he will forego more privileges, and endure more hardships than even the interests of self would induce him to do. This is true of a brother, but elder brother—how infinitely above all this! Brother is a sweet word, full of melody to every sister's ear, but "elder brother" is most peculiarly and emphatically so. For this reason, when CHRIST graciously styled himself our great Elder Brother, he allowed us to bestow upon him a dearer appellation than even "Abba, Father."

Elder brother! What are the thoughts that throng your busy brain, as you repeat that phrase? Does it remind you of neglect and unkindness, of angry words, or haughty treatment? Oh, no! it brings up naught but the most pleasing recollections. In childhood, your "elder brother" ever gave you the prettier toy—he led you over the smooth path—he climbed the rugged hill side to secure for you the treasure which lay at the top—in all his woodland rambles, he gathered the flowers and the mosses for you, his loved sister. He could jump over the laughing brook which danced through the meadow, but he would make the stony bridge for your dainty feet to tread. He was ever ready to explain the meaning of a beautiful picture, or an exquisite piece of statuary. His collection of stories and anecdotes, which he related as he cracked nuts for you in the long winter evenings, was inexhaustible. His willing fingers placed the frame to support your feeble flowers, and formed the trellis for your little vine.

When he was in College, loving letters he wrote to you, detailing all the pleasing incidents in his college life; and when he came home in the vacation, what appropriate gifts he always brought to you! When you started for boarding-school, with what affectionate earnestness did he caution you against the snares and temptations into which you would be likely to fall! With how much tender sympathy did he listen to the recital of your little vexations, and with what joy did he learn of your happiness! With his similar tastes, and his strong, manly nature, he enabled and strengthened you. With what fervency did he endeavor to lead you to know CHRIST! With what winning words and sweet entreaties did he tell you of a Savior's love, and urge you to accept a Redeemer's atonement! What solicitude did he ever manifest that the gentlemen into whose society you were thrown, should be of the best character! When the fortunate one at length arrived, and you were "betrothed," you loved your brother none the less because you had found a new love; he was still allowed the old place in your heart's affections.

In after years, when he and yourself are surrounded with family cares, he was still advising schemes for your happiness, and you looked up to that "elder brother" with the same respect and affection that you did when a girl. And now that he has passed away from this world's care, and your head is silvered with age, your form bent, and your step feeble, you still love to think of that sainted one, and his virtues lie deeply enshrined within your memory's casket.
Angelica, N. Y., 1858. CORA L. LATIMER.

THE duties which we owe to our own moral being are the ground and condition of all other duties; and to set our nature at strife with itself for a good purpose, implies the same sort of prudence as a priest of Diana would have manifested, who should have proposed to dig up the celebrated charcoaled foundations of the mighty Temple of Ephesus, in order to furnish fuel for the burnt offerings on its altars. Truth, virtue, and happiness may be distinguished from each other, but cannot be divided; they subsist by a mutual coexistence, which gives a shadow of divinity, even to our human nature.—Colveridge.

Written for Moore's Rural New-Yorker.
THE PHYSICIAN.

How largely is the world indebted to the medical profession. How much of the skill and knowledge that is the means of alleviating the woes of suffering humanity is committed to physicians; yet how few give them that respect and true sympathy every true member of the profession deserves. Whose toils more arduous—whose responsibilities more pressing—than his, who, regardless of personal comfort, in darkness and tempest hastens to obey the summons that calls him to the bedside of a suffering fellow-creature, well aware that upon his promptitude life and death may depend. How many have toiled until prematurely old and care-worn; yet one-half the world regard their obligation to their physician as entirely a pecuniary one, nor think that a debt of love, and gratitude, and veneration is due to one who, under God, has raised them from the weary couch of pain—brought back from the borders of the tomb those dear as life itself, or ministered by the dying bed of departed ones. That there are those who are a disgrace to the profession, we will not deny,—that it has given to the world some of the loftiest specimens of philanthropy and manhood, we confidently affirm. We have no sympathy with that littleness that regards paltry dollars and cents as the only merited compensation of those who bear the lamp of science in the midst of pestilence, contagion, and death. We regard them as the instruments of God's benevolence—we reverence the profession and every member who worthily bears its insignia.
Sherburne, N. Y., 1858. LINA LEE.

MONOTONY.

MONOTONY is pleasant in itself; morally pleasant, and morally useful. Living in the same house is monotonous; but three removes, say the wise, are as bad as a fire. I delight in that same monotony. It causes curiosity, anxiety, excitement, disappointment, and a host of bad passions. It gives a man the blessed invigorating feeling that he is at home; that he has roots, deep and wide, struck down into all he sees; and that the only being who will do nothing cruel or useless, can tear them up. It is pleasant to look down on the same parish day after day, and say, I know all that lies beneath, and all beneath know me. If I want a friend, I know where to find him; if I want work done, I know who will do it. It is pleasant and good to see the same trees year after year; the same birds coming back in spring to the same shrubs; the same banks covered with the same flowers, and broken (if they be stiff ones) by the same gaps. Pleasant and good it is to ride on the same horse, to sit in the same chair, to wear the same old coat. That man who offered twenty pounds reward for a lost carpet-bag full of old boots, was a sage, and I wish I knew him. Why should one change one's place, any more than one's wife and one's children? Is a hermit crab, slipping his tail out of one strange shell into another, in the hopes of its fitting him a little better, either a dignified, safe, or graceful animal? The oftener one sees, the better one knows; and the better one knows, the more one loves.—Fraser's Magazine.

SET A GOOD EXAMPLE.

Nothing is so easily done as to preach and talk of obligations which we are under to do justly and to walk humbly; but it is altogether a different matter to write, and preach, and talk by example. And yet, though the former be useful, how much more valuable and effective is the latter? What are those most beautiful essays on the cardinal virtues compared with the excellence of the life in which these virtues have a living and vital existence? It was not alone the doctrines, advanced with such dignified and persuasive eloquence by our Savior, nor the wonderful miracles performed by him, which made the hearts of men follow after him; these were rendered doubly effective by the example which he set at all times, even under the most trying circumstances.

And so it is now, in a humble sense, by mere human hopes. Men may preach and the world will listen, but profit comes by example. A parent, for instance, inculcates gentleness to his children by many sound precepts, but they see him treat his beast in a rude and angry manner, and, in consequence, his instructions are worse than lost, for they are neither heeded nor respected. His example, as a gentle and humane man, would have been sufficient for his children without one word of command. Men are just like children in this respect, and imitate a good example, while precept alone, will pass into one ear and out at the other.

THE NEWSPAPER.—On Wednesday week the Louisville (Ky.) Journal reached its twenty-eighth year, and its Editor, GEORGE D. PRENTICE, in a review thereof, feelingly remarks:—"The history of a newspaper is much of the world's history.—The daily paper is the day's history—it clasps the world's daylight. Bound in its daily columns, the world, with all its passing events, circles. In our modern life the newspaper is truly

'A real world
Round which, with tendrils strong as flesh and blood,
Our pastime and our happiness may grow.'

"In it the steamship arrives and unloads her freightage; in it the lightning flashes for thought; in it the city booms, the corn blades glitter, the wheat rustles in its golden heads, the cattle low from a thousand hills, and the market hums; in it the spring blooms and the autumn blows; in it the poet sings, and with his song the low wind comes fresh and sweet over old meadows, and happy faces gleam from forgotten doors. Yes, the world turns every day in the daily newspaper. Its columns are freighted with the world's merchandise. Through their avenues ring merrily the marriage bells, and through them hearse move and funeral knells are tolled."

READING.—Reading is one of the greatest consolations of life; it is the nurse of virtue, the upholder in adversity, the prop of independence, the support of a just pride, the strengthener of elevated opinions; it is the shield against the tyranny of all petty passions; it is the repeller of the fool's scoff and the knave's poison.

Sabbath Musings.

Written for Moore's Rural New-Yorker.
THE ANGEL OF HOPE.

BY IDA FAIRFIELD.

I COME to the sorrowing sons of earth,
And lo! in their hearts, new joys and birth,
When the wild, dark storm, the heaven enshrouds,
I weave my brow in the blackest clouds;
And the Mariner looks from the foaming wave
To the bright land, stretching beyond the grave.
I wave my wand in the Beggar's sight,
And he dreams of a home in a palace bright,
Where hunger, and cold, and want come not,
And the blither present is all forgot.
Weary with toil and worn with care,
The Laborer bends in weak despair,
All life's energies must he give
For the paltry bread on which to live,
And he turns from his work with a weary sigh,
Praying only that he "might die."
But I speak to him of a "coming time"
Still in his inauspicious prime,
When he shall sit at well-filled board,
With granaries heaped, and gold well stored,
His wife and little ones by his side,
Filling his heart with a loving pride,
Happy with books, and friends, and flowers,
Dreaming away life's golden hours
With the pleasant thought, his heart beats quick,
And the anvil rings with the hammer's click,
And the hours sit by on unseen wings,
Bright with the joys which the future brings.
When Friendship whispers a sad "good-bye,"
Or sorrowing Love with a tearful eye,
Extends the parting hand, still near,
To wipe from beauty's cheek the tear,
I draw and paint with magic power
The pleasures of the "meeting hour."
If friends prove false as fortune fair,
Or grim disease the young cheek pales,
Or sorrow comes, all tears I dry,
With visions of a bright hour nigh.
And none alone of earth I sing,
Around the dying hovering,
I whisper of that Better Shore,
Beyond the Unknown River's roar,
And life's last hour in triumph dies,
Like suns which set in gorgeous skies.
New Haven, Conn., 1858.

Written for Moore's Rural New-Yorker.
THE ABSENT.

"THY come at the gentle even-tide,
The noble who have wandered; the lovely who have died."
To most as I sit by the glowing fire-light listening to the wild wind's wail without, thoughts of loved ones far away twine around my heart, and down fond memory's hall comes echoing the gleeful tones I used to hear, causing me to rejoice again with the old-time gladness. But this is only a reverie. As I rouse from my dream, fainter and fainter, to my ear come these well-known sounds, while at my side the prattling voices of little brothers bid me turn from the mystic past, to listen to their words of childish love and innocence. Yet, they cannot disperse the sunny memories that crowd my heart to-night.

Arrayed in immortal beauty comes the form of one much loved, bringing to me glad tidings from the spirit-land, and portraying to my vision the beauties of her home in Paradise. List! she sings to me the exciting songs taught her by the Most High. Upon my cheek I feel her breath, and hovering o'er me her angel wings, "Daughter of earth!" she says, "thou hast a work to do. Lay aside all worldly ambition and glory, and improve the gift thy God has given thee. Go and minister.

Unto the sorrowing and oppressed,
And tell them of eternal rest."
How refreshing to the weary heart these sacred communions with those who have long wandered from us, and who we never expect to meet this side of eternity. But we are fast hastening on to greet them, and our barks 'mid wrecks and fears, are pushing their way through time's pathless deep, and when a few more winds and storms have beat against them, "Our Father" who ever stands at the helm will anchor us safely on the "fair banks of deliverance."
Onondaga Hill, N. Y., 1858. ROSA BAKER.

LIFE'S VOYAGERS.

I KNOW him, a man of years, with silver locks and gentle eyes, that give a genial warmth to his wan face, where dwells the smile of Content. His is a face that the friendless and the stranger love to look upon, for there they read the truth of Friendship. He was blessed with a companion that fully possessed his virtues, and where such hearts meet, what a halo of brightness must surround their pathway. Here was a spirit to cheer the desponding and lonely—to lift the dark curtain of sorrow from wounded hearts, and shed a mother's love around their footsteps. Quietly life's current has borne them gently along—their way has been one of pleasure. Often had the golden sunlight of life scattered its life-giving rays about them. If ever dark clouds cast a shadow o'er the scene, it was but a momentary darkness that, when past, more fully revealed the brightness of those stars that shone forth in their congenial sky.

A change came—how great a change! The mother had disappeared beneath Death's dark waves; and as they closed over her, she whispered, "Peace—Peace." Alas! for the lone voyager, who is now upon Time's river companionless. But he looketh up, and saith—"my Father doeth all things well—in Him will I trust." Methinks I see him nearing the great Ocean of Eternity—no sunken rocks are in his pathway, nor falls the sullen roar of angry billows upon his ears. In calmness he awaits the heavenly breeze that will waft him to his glorious home.
Shuau, N. Y., 1858. M. A. H. H.

THERE is not a spider hanging on a king's wall but hath its errand; there is not a beetle that groweth in the corner of the church-yard but hath its purpose; there is not a single insect fluttering in the breeze but accomplishes some divine decree; and I will never have it that God created any man, especially any Christian man, to be a blank, and to be a nothing.—Spurgeon.

HUMILITY.—The sufficiency of my merit is to know that my merit is not sufficient.—S. Augustine.

The Educator.

Written for Moore's Rural New-Yorker.
AN APPEAL FOR MY SISTER TEACHERS.

It is not my purpose to introduce or advocate "Woman's Rights," but Teacher's Rights. At the late Teacher's Institute of Livingston Co., a resolution was passed to the effect that lady teachers should receive the same compensation as gentlemen. Recently, a lady, well qualified for teaching, mentioned the passing of such a resolution to a wealthy trustee of one of our district schools, and failed to elicit aught but an unfeeling rebuff. He virtually admitted that ladies are generally as well qualified, in an educational point of view, and are quite as successful in governing our district schools, but still maintained that they would not and should not receive an equal compensation for their labors. Why was this so? The question remained unanswered. Who can look upon such a man, other than being a hater of woman, her interests and well-being? How revolting to our ideas of justice when a stronger party preys upon a weaker, with no other motive than to crush the object within its power, because that power is superior. How our sympathies are enlisted in behalf of the oppressed, and how quickly we lend our aid to their rescue. Is it not wrong that man, who should be the protector of dependent woman and jealously watch over her interests to avenge the usurper of her rights, should rise up in rebellion to the voice of justice and crush unoffending woman to the dust? How strong is the contrast between such a course, and the zeal with which our cause was advocated by our noble brothers of the Institute.

It has been affirmed that gentlemen should leave the profession of teaching for the ladies. Altho' there are many other pursuits in which they may engage, not accessible to us, we do not wish to drive them from the field. We heartily desire their cooperation in this important and responsible vocation. Indeed, the education of our youth would be incomplete if intrusted to either sex alone. Man may chisel out the rough, unpolished statue, but to woman remains the task of adding a grace and beauty to the sculptured marble, which makes it almost breathe, as it approaches the perfection of the artist's ideal. All we ask is an equal compensation for an equal task as well performed. If we do it not as well we should not be employed, for certainly, our male teachers are none too competent. If we stand as high in our calling, why should there be any difference? Is the same amount of good of less value because woman is the instrument?

Woman labors under many disadvantages in arriving at the same degree of excellence as a teacher, to which man is a stranger. Is she obliged to obtain an education by her own hands? The reward which she has received for any labor has been so little as to render it nearly impossible for her to pursue a liberal course of study, and the poor remuneration she has received has made it but a small object to prepare for this profession. There are occupations in which a deficiency of physical strength renders woman incapable of performing the same amount of labor, but teaching cannot be included. But, notwithstanding difficulties, does she not stand as high in her calling as the other sex? Her occupation has been that of teaching since the days of Mother Eve.

All the great volume of mind which has led discovery, sounded the trump of freedom, enlarged the boundaries of science, beautified the halls of art, fathomed the depths of philosophy, or renovated the face of society, has been trained and moulded by insignificant woman. To the meek and holy Moses are we indebted for the only reliable narrative of a period of two thousand five hundred and fifty-three years. We do not know that he would ever have written the Pentateuch, had not his mother early taught him to "prefer suffering affliction with the people of God to enjoying the pleasures of sin for a season." Who but woman first instructed the heroes of Rome? There were noble mothers and daring sons, loving sisters and brave brothers, devoted wives and valiant husbands; and, coming down to the cherished days of our own revolution, we read of Mary and Martha Washington, and join with the "Father of our Country" himself in saying that, under God, they made him what he was. Woman is destined to be the teacher of mankind, and it remains with man to furnish a compensation for honest and persevering industry sufficient to enable her to become an intelligent instructor. If parsimonious committees drive our female teachers from the Common Schools, they will still teach through the sons and the brothers whom they educate at the social fireside. By the law-givers and the statesmen sent forth from the sacred precincts of home to hold in their honored hands the reins of government, they will teach. By that sweet and holy influence which it is the high privilege of woman to exert, she will teach. Parents, friends, people, do you hope to see your descendants and your country great, and good, and noble,—exalted in point of excellence and civilization,—educate your daughters and your sisters, for they are to be the prime instructors of the human family.

Upon the foundations laid in the nursery, are built the school-house and the academy, the college, and the Hall of State. After having laid the base, shall not woman also lay the corner-stone to this beautiful edifice, which is our Common School? Our female teachers, above any other of their sex, are worthy to be respected, assisted and sustained. They occupy that place in the social circle which is, of all, the most influential. They are not the uninformed, or the phibian, neither are they the proud daughters of fashion. None but the truly refined mind,—too often well disciplined in the school of stern necessity, will assume such a task. In the teacher's own mind, the true ideal of character must be formed and approach realization as she can understand, or mould the character of the pupil. Not having been nursed in the lap of luxury and wealth, her ideas of life and its end, embrace something higher than mere personal gratification or present happiness. Here is not the "poetry of imaginative life," but "the simplicity of practical life," and she looks upon the gift of her being as a precious thing entrusted to her care, the projector of a battle in which to engage is an earnest reality. Her calling permits

her not to cherish a selfish and exacting spirit; but insures patience, forbearance and persevering effort. Such minds must renovate society, if it is done at all. Such, and such alone, should stand at the helm to guide the wayward mind of childhood across the great ocean of wisdom to be spanned by the venturesome youth. Strong minds and pure hearts should steer the precious craft 'till its captain learns to grasp the helm with the strength of manhood, and can himself guide it to anchorage in the sea of eternal rest. Ye who have been accustomed to spurn the efforts of those gentle applicants at the door of justice to equal their good brothers in the art of teaching, do not any longer discourage her who presides in your school-room, but lend her a helping hand in her noble endeavor, and she will abundantly repay your timely aid.

Pittsford, N. Y., Nov., 1858. JAMES E. H.

PUNCTUATION.

We present to the readers of the Journal in this article a more remarkable instance of the effect of punctuation in changing the meaning of the sentence than any previously given. It is taken from Colgrove's Grammar, published in Cleveland, Ohio, in 1852.

Richard Green Parker says James Russell Lowell is a great genius.

In giving the different punctuations which this sentence may have, we shall not follow the order adopted by Mr. Colgrove, nor use italics as he has done.

1. Richard.—Green Parker says, "James Russell Lowell is a great genius."

2. Richard Green, Parker says, "James Russell Lowell is a great genius."

3. Richard Green Parker says, "James Russell Lowell is a great genius."

4. "Richard Green Parker," says James Russell Lowell, "is a great genius."

5. Richard, "Green Parker," says James Russell Lowell, "is a great genius."

6. Richard Green, "Parker," says James Russell Lowell, "is a great genius."

7. "Richard Green Parker," says James Russell Lowell, "is a great genius."

8. "Richard Green Parker," says James Russell Lowell, "is a great genius."

9. Richard Green Parker says, "James Russell Lowell is a great genius."

10. Richard Green Parker says, "James Russell Lowell is a great genius."

11. Richard, Green Parker says, "James Russell Lowell is a great genius."

12. Richard, Green Parker says, "James Russell Lowell is a great genius."

13. Richard Green, Parker says, "James Russell Lowell is a great genius."

14. Richard Green, Parker says, "James Russell Lowell is a great genius."

15. "Richard Green," Parker says, "James Russell Lowell is a great genius."

16. "Richard," Green Parker says, "James Russell Lowell is a great genius."

We have given two more readings than Mr. Colgrove; whether others may not also be given we leave the reader to ascertain.

It is evident that each one of the above examples will admit of several elocutionary readings, which will add to the number of ideas that may be conveyed by the sentence.—*Indiana School Journal.*

COMPRESSION IN ORATORY.

ELOQUENCE we are persuaded, will never flourish in America, or at home, so long as the public taste is infantile enough to measure the value of speech by the hours it occupies, and to exalt copiousness and fertility to the absolute disregard of conciseness. The efficacy and value of compression can scarcely be overrated. The common air we beat aside with a breath, compressed, has the force of gunpowder, and will rend the solid rock; and so it is with language. A gentle stream of persuasiveness may flow through the mind and leave no sediment; let it come at a blow, as a cataract, and it sweeps all before it.

It is by this magnificent compression that Cicero confounds Cataline, and Demosthenes overwhelms Eschines; by this that Mark Antony, as Shakespeare, makes him speak, carries the heart away with a bad cause; by this that Lady Macbeth makes us, for the moment, sympathizing with murder. The language of strong passion is always terse and compressed; genuine conviction uses few words; there is something of artifice and dishonesty in a long speech. No argument is worth using, because none can make a deep impression, that does not bear to be stated in a single sentence. Our marshaling of speeches, essays and books according to their length, deeming that a great work which covers a great space—this inordinate appetite for printed paper, which devours so much and so indiscriminately, that it has no leisure for fairly tasting anything—is pernicious to all kinds of literature, but fatal to oratory. The writer who aims at perfection is forced to dread popularity and steer wide from it; the orator who must court popularity, is forced to renounce the pursuit of genuine and lasting excellence.—*Westminster Review.*

NEVER DESPAIR.—True hope is based on energy of character. A strong mind always hopes, and has always cause to hope, because it knows the mutability of human affairs, and how slight a circumstance may change the whole course of events. Such a spirit, too, rests upon itself; it is not confined to partial views, or to one particular object, and if at last all should be lost, it has saved itself—its own integrity and worth. How awakens courage, while despondency is the last of all evils; it is the abandonment of all good—the giving up of the battle of life with dead nothingness. He who can implant courage in the human soul is its best physician.—*Von Knebel.*

A LONG WALK AFTER A DIPLOMA.—One of the recent graduates at Oberlin, has, during his whole preparatory and collegiate course, boarded at his father's, several miles from the College, and walked back and forth daily to his recitations. From a careful computation, it appeared that at the time of his graduation he had walked *ten thousand miles*. He was apparently the youngest of his class, but he delivered a Rudibrastic poem on the Union, which was received with great favor. His diploma was well earned.

Useful Olio.

MUSICAL PRACTICE AMONG BIRDS.

MANY imagine that birds sing by instinct, and that their songs come to them without any labor or practice. But ornithologists, who have made the habits of the feathered tribe a life-study, hold a different theory, and tell of long and laborious practices in species and individuals, to acquire a facility and compass of song. The following information, from a practiced observer, will be new to many of our readers:

"Birds have their peculiar way of song. Some have a monotonous tone as the bay-winged sparrow. The yellow bird has a continuous chatter, without any particular form of song. The cat bird is a mocker; the golden robin has a song of its own; but each one may have a song of its own, though those of the same locality are apt to sing the same tune. The hermit thrush has a round of variations, perhaps the sweetest singer of the feathered choir. But the song sparrow has the most remarkable characteristics of song of any bird that sings.

Every male sparrow has seven independent songs of its own—no two having the same notes throughout, though sometimes, as if by accident, they may hit upon one or more of the same.

Some males will sing each tune about fifty times, though seldom; some will only sing them from five to ten times. But so far as I have observed, each male has his seven songs. I have applied the rule to as many as a dozen birds, and the result has been the same. I would say that it requires a great degree of patience, and a good ear, to come at the truth of the matter; but any one may watch a male bird while singing, and will find that he will change his tune in a few minutes, and then in a few minutes more.

A fine male sparrow has frequented the same vicinity five springs in succession, singing the same seven songs, always singing, within a circle of about twenty rods. On the fifth spring he came a month later than usual; another had taken possession of his hunting grounds, so he established himself a little one side. I noticed that he sang less frequently than of old, and in a few days his song was hushed forever. No doubt old age claimed him as a victim. In other cases, I have known a singer to return to the same place, two, three and four years; but frequently not more than one. I think there is not a more interesting or remarkable fact in natural history, than the one I have related, and it is a fact you may confidently believe.—*Fisk's Family Journal.*

WITCHCRAFT IN EUROPE.

IN the course of the century during which this fearful persecution was at its height in Germany—from 1580 to 1680—it is calculated that more than 100,000 individuals, nine-tenths of whom were women, were its victims. To the honor of humanity be it said, some voices were raised against this blood thirsty practice, but they were drowned in the general clamor. In every part of Germany, Protestant or Catholic, the same atrocities were committed. At length, in the year 1631, the noble-hearted Count Frederick of Solms, himself a member of the order of Jesuits—an order which had been amongst the most violent denouncers of sorcery—ventured to step boldly forward and declare that, among the many whom he had accompanied to the scaffold, there was not one whom he could confidently declare guilty. "Treat me so," he added, "treat in this manner the judges or heads of the Church, subject us to the same tortures, and see if you will not discover sorcerers in us all." Despite this burst of generous indignation, it was not until 1694 that this incomprehensible insanity began to abate. The last so-called witch burnt in the German empire was a poor nun, aged seventy, in the year 1743, at Berg. But at Glarus, in German Switzerland, an execution of a similar nature took place as late as 1794. This time the victim was a servant girl, accused of having practiced diabolical arts to lame the child of her employer. Germany, indeed, seemed to live in an atmosphere of sorcery. The ground which Faith had lost Superstition made her own.

DURATION OF LARVA LIFE.

IN the "Linnaean Transactions" there is an interesting account, by Mr. Marsham, of the coming forth of the perfect form of *Euprestes splendens*, an exotic insect, which is a wood borer in its larva shape, and which he infers, from the following circumstances, and have passed full twenty years in the larva state. In the year 1810 the perfect insect emerged from the wood of a desk made of foreign wood, for a public office, in 1788-89, from which the long period of its larva existence seems pretty clearly shown. It would seem that meat-eating larvae undergo their change most quickly, and that those feeding underground or in wood, are the most tardy in their transformations; while those which are leaf-feeders, such as those of butterflies, &c., hold a medium place. Bees remain about twenty days in the larva stage. The Cossus and the May bug are said to pass three years in the larva state; and the Beetle—*Oryctes nasicornis*—four years. The larva of the Stag Beetle does not change for six years; while some of the wood-eating larvae are supposed to live in that stage very much longer.—*Insect Vicarum.*

ROBERT FULTON.—Among a thousand individuals, you might readily point out Robert Fulton. He was conspicuous for his gentlemanly bearing and freedom from embarrassment; for his extreme activity; his height somewhat over six feet; his slender yet energetic form, and well-commodated dress; for his full and curly dark brown hair, carelessly scattered over his forehead, and falling about his neck. His complexion was fair; his forehead high; his eyes dark and large and penetrating, and revolving in a capacious orbit of cavernous depth; his brow was thick, and evinced strength and determination; his nose was long and prominent; his mouth and lips were beautifully proportioned, giving the impress of eloquent utterance, equally as his eyes displayed, according to phrenology, a pictorial talent and the benevolent affections.—*Dr. Francis.*

WINTER SHOES.

HALL'S *Journal of Health* gives the following sensible advice:—"Like the gnarled oak that has withstood the storms and thunderbolts of centuries, man himself begins to die at the extremities. Keep the feet dry and warm, and we may snap our fingers in joyous triumph at disease and the doctor. Put on two pairs of thick woolen stockings, but keep this to yourself; go to some honest son of Saint Crispin, and have your measure taken for a stout pair of winter boots or shoes; shoes are better for ordinary, every-day use, as they allow the ready escape of toe odors, while they strengthen the ankles accustomed to depend on themselves. A very slight accident is sufficient to cause a sprained ankle to an habitual boot-wearer. Besides, a shoe compresses less, and hence admits of a more vigorous circulation of blood. But wear boots when you ride or travel.—Give direction, also, to have no cork or India rubber about the shoes, but to place between the layers of the soles, from out to out, a piece of stout hemp or tow linen which has been dipped in melted pitch. This is absolutely impervious to water—does not absorb a particle—while we know that cork does, and after awhile becomes 'soggy' and damp for weeks. When you put them on for the first time, they will feel as 'easy as an old shoe,' and you may stand on damp places for hours with impunity."

TREATMENT OF FROSTED FEET.—To cure the intolerable itching that follows frost bitten toes, it is necessary to totally exclude the air from the affected part. If it is not accompanied with swelling, gum arabic, dissolved in alcohol, applied so as to form a complete coat, is the easiest remedy that I know of. It dries soon, and does not adhere to the stockings, and generally lasts until they are well. If the flesh becomes swollen and painful, plasters of good sticking salve are of great service, but, if highly inflamed, any mild poultice that will exclude the oxygen of the air from the diseased part, and keep it moist, allowing the recuperative powers of nature to do the rest.—*Selected.*

The Young Ruralist.

DESCRIPTION OF SNOW-FLAKES.

Now that winter is with us, pinching our fingers and toes, and covering the earth with its pure and beautiful mantle, a few facts about the snow will not be uninteresting or unprofitable to our young readers. The size of the snow flakes depends upon two causes: when the atmosphere abounds in vapor and the temperature is near 32° Fah., the flakes are large; and as the moisture diminishes and the cold increases, the snow becomes finer. In the former condition of the atmosphere it is not uncommon to see flakes that are an inch in diameter. The lower the temperature the less the diameter of the flakes. At 10° Fah. snow-flakes rarely exceed seven-hundredths of an inch in diameter. Snow has been known to fall with a temperature that caused the mercury to fall 12° and even to 20° below zero. But this is not common.

The snow flakes have a great diversity of form, which, as every accurate observer will testify, constitute beautiful and regular crystals; and it is the copious reflection of light caused by these, that gives snow its brilliant whiteness.

The bulk of snow, just fallen, is ten or twelve times greater, (more or less, depending upon the temperature and moisture of the atmosphere,) than that of the water produced by melting it.

FORMS OF SNOW FLAKES.

Isolated crystals unite under angles of 30, 60 and 120 degrees. These by their different modes of union form several hundred distinct varieties of snow-flakes. FOREBY, an Arctic navigator of great celebrity has enumerated six hundred; and these are all comprised under five classes. According to ROBERTS the star figure, (fig. 4) in the diagram given above, is observed when the thermometer is near the freezing point. The hexagon, (fig. 2) is seen both in moderate and very low temperature. The diagram given above presents only eight of the ninety-six figures delineated by SCHEUSSER. From it, however, the reader may be led to observe for himself, the great variety of forms which Infinite Wisdom has given bodies of so small a bulk as snow-flakes.

The uses of snow are well known to the intelligent farmer. It has been properly styled, "the poor man's manure." It forms a warm covering for the soil, and thus defends vegetation from the severity of the winter. It also diminishes the intensity of the darkness during the long winter nights, and furnishes a favorable opportunity for the farmer to replenish his wood-pile, to move his fencing materials, and to carry his surplus produce to market. To the young folks we need not speak of the uses of snow. Indeed, the boys, and girls, too, we think could enlighten us on this point, for it is a long time since we went "coasting," or took long rides of winter evenings behind fast steeds and jingling bells, and beside the girl that we thought the best in the whole town.

THE SEA STAR, OR STAR-FISH.

SCORES of times, in our younger days, after storms, or during low water at "spring-tides," have we amused ourselves in catching and examining these singular fish. They are covered with a coriaceous crust, and have five or more rays proceeding from a centre, in which is situated the mouth. A prodigious number of tentacles, or short fleshy tubes, which seem at once calculated to catch prey, and to anchor the animal to the rocks, proceed from each ray. The mouth is armed with long teeth, for the purpose of breaking the shells on which the animals feed. The animal breathes by means of gills. The common, or five-rayed star-fish, (*Asterias rubens*, Linn.) which is the species here represented, has five angular rays, with prickly protuberances at the angles. When alive, it is usually of a brownish white color. In one of these, which he kept for some time, Mr. BINGLEY observed more than four thousand tentacles, on the under side of the rays.

In summer, when the water of the sea is warmed by the heat of the sun, they float on the surface, and in the dark they send forth a kind of shining light, resembling that of phosphorus.

They are often fastened to the rocks, and to the largest sea shells, as if to derive their nourishment from them. If they be taken and put into spirits of wine, they will continue for many years entire; but if they be left to the influence of the air, they are, in less than four and twenty hours, melted down into limpid and offensive water.

In all of this species, none are found to possess a vent for their excrements, but the same passage by which they devour their food, serves for the ejection of their forces. These animals, as was said, take such variety of figures, that it is impossible to describe them under one determinate shape; but, in general, their bodies resemble a truncated cone, whose base is applied to the rock to which they are found usually attached. Though generally transparent, yet they are found of different colors, some inclining to green, some to red, some to white, and some to brown. In some, their colors appear diffused over the whole surface; in some they are streaked, and in others often spotted. They are possessed of a very slow, progressive motion, and, in fine weather, they are continually seen stretching out and fishing for their prey.

REPLY TO QUESTIONS OF W. B. B. MINNESOTA.

"Is due East and West on a parallel to the equator?" Certainly not. The question implies that the meaning of East and West, as points, is not understood. Take one of the common definitions, as East is the direction in which the sun rises at the equinoxes, and West, where the sun sets at the equinoxes; or, East and West are the points where the equator cuts the horizon, and hence, when the sun is on the equator, it must rise at the east, and set at the west at all places. The next question is absurd on either of these definitions. For, when the sun is at the equator, it rises at the east point and disappears below the horizon at the west. At the poles of the earth, the east must be on a meridian, or coincide with the south line.

If "due East and West" were "on a parallel to the equator," we could not explain the phenomena presented. The equator is a circle lying east and west, but a parallel to it is not, as the earth is a globe or sphere, nearly.

After the Vernal Equinox "the sun advances north" to the time of the summer solstice, or the longest day, and of course "continues to rise and set farther north of east and west." The greater the latitude of the place, the further is the rising and setting of the sun "north of east and west." Take the time of summer solstice: at this city in latitude 45°, the sun rises and sets about thirty degrees north of east and west, on that day; at Cincinnati, latitude 39°, about twenty-eight degrees; at latitude 45°, or near St. Paul's, about thirty-five degrees; and at Hebron, Labrador, latitude 58°, about forty-six degrees "north of east and west," as any one may see on a globe.

The questions are answered, and the subject explained once more, it is hoped, clearly and definitely. a. d.

THE INDIAN BEAN.

EDS. RURAL:—I have become a constant reader of your valuable sheet. My object in writing to you is to introduce a new kind of Bean; the seed came from the eastern border of the Indian Territory. My father, while traveling through that country, obtained the seed from an old settler; the bill of fare in his travels being pork and this kind of bean. They are called the Indian Bean. They resemble very much our common pea in shape.—I had about a gill of seed which I planted in a garden that my father gave me to plant, and to take care of. My folks think they are far superior to any other kind, even the Lima. They yield largely and I think it is a paying crop. They grow something like a pole bean, half-way between a pole and bush bean. The pods are from six to eight inches in length and they contain from fifteen to twenty beans, and they are well adapted to this climate. Cultivate them as you would the bush bean. I will send you a small sample and if you wish to try more, write me and I will send you a small package by mail.—F. B. A., Rockford, Ill.

REMARKS.—We never saw this bean before. It is of a reddish drab color, about the form and size of our common field pea, and looks more like a pea than a bean, and indeed has a good deal of pea taste. We will plant the sample sent us, and if as valuable as our young friend thinks, we shall consider them quite an addition to our list of vegetables.

LIBRARIES.—Libraries are the shrines where all the relics of ancient saints, full of true virtue, and that without delusion or imposture, are preserved and repose.—*Lord Bacon.*

- Francis C. Walton, one of the members of the Kane Arctic expedition, was buried in Philadelphia, on Sunday. He died in destitution.
- The Court of Appeals has decided that County Courts have jurisdiction of actions to foreclose mortgages on lands within their counties.
- Preparations are made for a great lumber season in Maine. On the St. Croix river alone about 10,000 men and 500 teams will be employed.
- The editor of the Franklin (Louisiana) Banner speaks of having received an orange seventeen and five-sixteenths of an inch in diameter.
- The navigation of the Mississippi river below St. Paul has been closed by ice. The mail will be carried by stages from St. Paul to La Crosse.

Moore's Rural New-Yorker.

"EXCELSIOR!"

TERMS OF THE RURAL-1859.

GREAT REDUCTION TO CLUBS

Single Copy, One Year, - - -	\$2
Three Copies, " " " " " "	\$4
Six " " " " " " " "	\$10
Ten " " " " " " " "	\$15
Sixteen " " " " " " " "	\$22
Twenty " " " " " " " "	\$26
Thirty-Two " " " " " " " "	\$40

And any additional number at the latter rate—only \$1.25 per copy!—with a free copy for every Ten Subscribers over Thirty.

LIBERAL GRATUITIES.

In addition to the extra copies above offered, and any Premiums which we may hereafter offer for subscribers to the Tenth Volume of the *RURAL NEW-YORKER*, we will give to each of the One Hundred Persons sending the first list of Ten, or more, yearly subscribers to the *RURAL* after this date (remitting payment at our club rate—\$1.25 per copy,) a bound volume of the *RURAL* for 1859, price \$3.—or \$2 in Agricultural Books, post paid.

To each of the One Hundred Persons sending the first list of Ten, or more, yearly subscribers to the *RURAL* after this date (remitting payment at our club rate—\$1.25 per copy,) a bound volume of the *RURAL* for 1859, price \$3.—or \$2 in Agricultural Books, post paid, or a Cross of the Washington Medalion Penn, post paid, as preferred by the persons entitled.

PUBLISHER'S NOTICES.

PLenty of Time!—In answer to two or three recent inquiries, we would state there is yet abundant time to secure the Liberal Gratuities we offer for the first 100 lists of 10 subscribers, and first 100 of 10, 16, or 20. Indeed, as club lists do not usually come in to any extent until after Dec. 1st, we presume all who remit before the 10th or 15th will be sure of the extra premiums, and perhaps those who send as late as the 20th or 25th. But as there are indications of a rush this year, competitors should remit as early as possible.

THE MONEY WE RECEIVE.—Bills on all solvent Banks in the U. S. and Canada taken at par on subscription to the *RURAL*, but our agents and other friends will please remit New York, New England or Canada money when convenient. Postage Stamps can be remitted for fractional parts of a dollar. For all amounts over \$10 we prefer Drafts on either New York, Philadelphia, Boston, Albany, Rochester or Buffalo (less exchange), payable to our order—and all such drafts may be mailed at the risk of the Publisher. If our friends throughout the Union, British Provinces, &c., will comply with these suggestions so far as convenient, the favor will be appreciated.

ANY PERSON who remits pay for a club of 10, 16 or 20 at the specified rates for such club, and adds a sufficient number within one month thereafter can avail himself of the advantage of the lower price of large club, and retain the amount overpaid. Thus, a person remitting \$16 for 10 copies, could obtain 10 copies more within a month by sending only \$11.

IN ORDERING the *RURAL* please send the best money conveniently obtainable, and do not forget to give your full address—the name of Post-Office, and also State, Territory, or Province.

NOW IS THE TIME

TO AID THE RURAL AND DO GOOD!

SUBSCRIBERS AND POST-MASTERS

Can perhaps aid us more than any other persons. From their position and standing they can exercise an influence in behalf of the *RURAL* which would materially increase its circulation and usefulness. We frankly ask their assistance in behalf of the enterprise, trusting that each and all will have the kindness to do what may be consistent toward introducing the paper to notice and support.

Merchants and their Clerks, Clergymen and Teachers, Officers of Ag'l Societies, Progressive Farmers, Periodical Agents,
All who have written to us for Specimens, And others, can also materially aid in augmenting the circulation of the paper—and of all who read this we bespeak such attention and encouragement as the *RURAL* may, in their good judgment, seem to merit. Any and every aid will be gratefully appreciated, and we shall be liberal in recognizing assistance by furnishing free copies, books, and other gratuities to those who introduce the paper in their respective localities.

HOW TO GET SUBSCRIBERS.

THE BEST WAY to obtain subscribers for the *RURAL* is to show a number. Its most successful agents and active friends say this is the true course—that few object to subscribing after seeing the paper itself. With a single specimen many persons have procured handsome lists. Much less effort is required than many suppose—for, in this case as in some others, seeing and examining is believing and convincing. Indeed, there is scarcely a town to which we send this Supplement, wherein from 10 to 30 subscribers could not readily be obtained by adopting the plan suggested, and using a little exertion. Now, as the present is the best season to try this plan, how many will act upon the suggestion—thereby augmenting the circulation and usefulness of the *RURAL*, and benefiting their neighbors and community? If any of our friends use up or lose their numbers in the good work we will cheerfully furnish others to make their files complete.

The greatly reduced Club Rates will render it comparatively easy to obtain a handsome list in almost any locality. Please try and see, Reader.

INFORMATION FOR AGENTS, &c.—A reader wishes to know whether we will forward the extra copy to a friend in Iowa, provided he can get a sufficient number of subscribers to entitle him to an extra. Also, whether we will send the *RURAL* for \$1.75, if he obtains 20 subscribers, and cannot get any more.
—To the first inquiry, we say **AYE**—will send the extra, or any club copy, wherever desired within the U. S. As to the other, would say that we must adhere to published terms in order to be consistent, and just to all. And really, five cents is a small item to individual subscribers, though of consequence to us in the aggregate. Our rates are already too low for such a paper as we intend to furnish, and we are surprised that any one should wish or suggest a further reduction.

Important from Mexico.

How the Austria took Fire.

According to a letter from the city of Mexico, under date of November 19th, addressed to the New York Times, that country is in a frightful condition. Such is the State of affairs, that the population hear of new atrocities without any expression of surprise. "The ink had scarcely dried on my last letter to you," says the writer, "in which I mentioned the execution of seven Americans at Zacatecas, (by the way, the Government has not officially announced this heroic act!) by one of the Government Generals, when we received the news that the same General had thrown an Englishman in capilla in Zacatecas, with orders to have him shot in a few hours, (I believe ten,) if he did not pay \$15,000 asked of him. The receipt of this news here was the cause of immediate action on the part of the British Minister. He wrote a most scathing note to the Government, and the Government expressed its disbelief of the story. The report has since been confirmed, and correspondence has ceased between Her Majesty's Minister and the Government. The next evening of our times to record, is the taking of the castle of Perote. This fortress, which has held out for ten months against the Government troops, fell, on the morning of the 16th inst., into the hands of Gen. Echegaray. The victory was gained without blood, although its consequences promise to be bloody. General Echegaray, in his dispatch to the Government, says he intends to shoot all the officers, from corporal up, and one-fifth of the soldiers!

"In the meantime, while these events have been taking place, the capital has been preparing for a state of siege. Trenches and breastworks have been arranged outside of all the garitas. The cause of this step of precaution is found in a general belief that in the next ten days this city will be again besieged by the enemy. Families in all the surrounding villages have been deserting their homes in the past week, and coming here. Three days ago orders were given for the suspension of the railroad trains leaving or entering the city after 5 P. M. The work on the fortifications still goes ahead, and at every quarter of an hour in these long nights, the cry of 'Sentinel a-lar!' goes up through all the lonely streets of this capital, horrifying to the ear as the howl of the hyena from a grave-yard."

LATER INTELLIGENCE FROM NEW MEXICO.—The St. Joseph (Mo.) Gazette of the 27th ult. says:—"We have been permitted to see a letter written to a gentleman in this city, dated Santa Fe, October 31st, in which the writer states that news was received in that city the evening previous of an attack upon Fort Defiance by the Navajo Indians. The Indians were repulsed with a loss of ninety killed; the troops sustaining a loss of four men. The Indians also drove a large number of horses belonging to the Government. The emigrants who were attacked at the crossing of the Colorado by the Mohaves, arrived at Albuquerque in a destitute condition, having lost eight hundred head of cattle, horses and mules, together with all their provisions and equipment. Their wagons were left on the Colorado, and they had to return to Albuquerque on foot, a distance of six hundred miles, nearly naked, and with nothing to eat but beef. The war in New Mexico will probably be one of long duration, and it will require more troops than are now in that country, to bring the Indians to subjection. At the present time the Navajos, Mohaves and Diggers are all hostile to the whites, and will not miss an opportunity of cutting off any small party that may attempt to pass through their country."

THE TRIP OF THE RUGGLES.—A letter from E. S. Prosser, to the Buffalo Commercial, gives the particulars of the trip of the Canal Steamer Ruggles, now at the east. She left Buffalo November 21st, at 8 P. M., with a load of beef, broom-corn and grass seed, as well as she could stow in the hold and between decks. She left Rochester at 7 P. M., on the 22d, only 23 hours from Buffalo, and left Utica at 7 A. M. on the 26th, having been detained seven hours by boats aground on the route. The entire trip from Buffalo to Utica was 83 hours, distance 264 miles, average rate of speed, including detentions, a fraction better than three miles an hour. Exclusive of detentions from other boats aground, the time was 76 hours, and the average speed about three and one third miles per hour. Mr. Prosser writes that with a perfect navigation there can be no doubt that steamers will go from tide-water to Buffalo in four days, and to New York in five days.

A WINDMILL PUMP AT SEA.—A late issue of the Cork Reporter, says that the Frondahung, of Liverpool, laden with rice for the Cape, put into Queenstown a day or two since in distress. She sprung a leak at sea, and was filling at such a rate that the ordinary pumps, exerted with the power of all, could not have saved her. In this strait her captain, Adam John Bray, betought him of a windmill pump, and the idea had no sooner occurred to him than he set about realizing it, and committed the execution of it to William Foulkes, his carpenter, who, being an expert at skillful artizan, carried out the captain's idea to perfection. By the power of this extemporized pump the vessel was kept afloat one hundred days, until she made Queenstown in safety, where she may now be seen, a signal proof of the power of the human mind, when energetically and ingeniously exerted, over the greatest difficulties.

CUBAN STATISTICS.—The population of Cuba at the last census, was a little over a million. The area embraced by the island and its dependencies, is 47,778 square miles. The great staples are sugar, coffee and tobacco, and the annual value of the products of the plantations is estimated at \$60,000,000, although only about one-twentieth of the island is in cultivation. The annual revenues of the government amount to something like \$13,000,000 a year. There are 1,442 sugar estates, 1,818 coffee estates, 912 tobacco estates, and about 10,000 grazing farms.

CANAL STEAMERS AND THE N. Y. CHAMBER OF COMMERCE.—The Special Committee of the Chamber of Commerce, on the 2d inst., reported in favor of steam on the Canals. They say it can be confidently affirmed, after full inquiry and trial, that the banks of the Canals will not be injured by propelling boats with steam. The report was adopted, and a memorial is to be addressed to the Legislature.

It is but a few weeks since we chronicled the destruction of the Ocean steamer Austria, by fire, and the loss of passengers. The cause of the disaster was attributed to the accidental upsetting of a kettle of tar, used for the purpose of fumigating the vessel. One of the passengers, PHILIP BRANT, contradicts this statement in a letter to the N. Y. Times. He says that on the day before the burning, it was reported on board that the Captain had made a bet that he would be in New York on the 18th, (the following Saturday). To do this would have required the vessel to make 200 miles a day, whereas she had only been making 211. To accomplish this, the fire was increased, and on Sunday evening the flames came out above the smoke pipe fifteen or twenty feet in the air—thus giving a column of sixty or seventy feet of flame from the funnels. The passage ways between decks became oppressively hot, and the whole vessel heated up. He further adds:

"Taking the captain's betting, together with its conditioned requirements, and the excess of fire in the furnace immediately afterwards, and these facts tell the simple story:—That they were pressing the vessel to the utmost, and which resulted in a step beyond the utmost!"

Now, at the time the alarm was given, the flames were coming in under the quarter-deck. They must have ravished already two hundred and fifty feet of the ship's length. If the tar-bucket was the cause of the fire, the fire started in the fore part of the steamer; and to completely overmaster the midsips, and find its way into the quarter-deck, by the time the alarm was given, must be explained by other principles than that of common sense."

Will this not give some clue to the captain's fatuity? Could not a guilty conscience—a consciousness of doing wrong, and the fear of this result—have been causes which made the captain a child when he should have been a giant?

THE ENGLISH INDIAN FUND.—The aggregate amount of subscriptions for the relief of the sufferers by the mutiny in India, was £433,620, or about two millions of dollars. Of this sum £127,286 were sent to India for distribution, the authorities there being authorized to draw for £10,000 more. In Great Britain about 240,000 were expended among 86 widows and orphans of officers, 298 widows and 423 children of soldiers, 6 widows of clergymen, and 23 widows and orphans of civilians. About £265,000 remain to be distributed. It is now contemplated to extend relief, which in many cases is greatly needed, to the troops, generally, stationed in India.

ENGLISH NEWSPAPERS.—It is said that within the last three years one hundred and fifty papers have ceased to exist, after a more or less protracted existence. The amount of capital thus invested and lost must have been large.

OBITUARY.

DIED, near Chagrin Falls, Ohio, Nov. 29th, 1858,—after a few days illness of fever, Mrs. LYDIA MOORE ROBINSON, (mother of Dr. D. T. Moore, of this city,) aged 65 years.

Mrs. ROBINSON was the daughter of Rev. ISRAEL HODGES, formerly of Exeter, Ohio, Co. N. Y., but for many years a resident of Mendon, in this county. At the age of 17 she was married to Rev. JOSEPH MOORE, (then of Washington county, but subsequently for many years Pastor of the First Baptist Church in Oneida, N. Y., and who performed much labor as a missionary in various sections of Central and Western New York and Ohio,) and reared a family of seven sons and two daughters. Her second husband was Mr. NATHAN ROBINSON—then of Oneida county, but for the past twenty years a resident of Ohio—who survives her, though upwards of 90 years of age. Mrs. R. early espoused the Gospel of Christ, and throughout all the prosperity and adversity of life was a consistent and devoted Christian.

VOL. IX. NO. 51.

ROCHESTER, N. Y.,—SATURDAY, DECEMBER 13, 1858.

{WHOLE NO. 467.

MOORE'S RURAL NEW-YORKER,
AN ORIGINAL WEEKLY
Agricultural, Literary and Family Newspaper.
CONDUCTED BY D. D. T. MOORE.
WITH AN ABLE CORPS OF ASSISTANT EDITORS.

THE RURAL NEW-YORKER is designed to be unsurpassed in Value, Purity, Usefulness and Variety of Contents, and unique and beautiful in Appearance. Its Conductors devote his personal attention to the supervision of its various departments, and carefully select to render the Rural an entirely Reliable Guide on the important Practical, Scientific and other Subjects intimately connected with the business of those whose interests it scholarly advocates. It embraces more Agricultural, Horticultural, Scientific, Educational, Literary and News Matter, interspersed with appropriate and beautiful Engravings, than any other Journal,—rendering it the most complete AGRICULTURAL, LITERARY AND FAMILY JOURNAL in America.

All communications, and business letters, should be addressed to D. D. T. MOORE, Rochester, N. Y.
For Terms and other particulars, see last page.

Rural New-Yorker.

AGRICULTURAL EDUCATION.

ONE of the most favorable signs of the times is the desire so apparent among young men to gain a good agricultural education. We have a host of letters inquiring where a knowledge of agriculture can be best obtained, and we see similar inquiries in most of the agricultural papers. We propose to give all the information we have in regard to the agricultural schools of this country, and for the principal facts we are indebted to Hon. JOSEPH R. WILLIAMS, President of the Michigan State Agricultural College.

THE AGRICULTURAL COLLEGE OF THE STATE OF MICHIGAN has been in actual operation since May 13th, 1857. Its Faculty consists of a President and four Professors, and it has accommodations at present for 100 students. Its design is to unite physical with mental culture, to afford the student a chance to earn in part his own education, and a chance to apply himself, free of tuition, to those sciences and practical arts, that may render him a scientific farmer and an enlightened citizen. The farm consists of 670 acres, mostly wild land, we believe, and therefore much of the time and labor of the students is devoted to chopping and clearing up. The institution, we understand is full. How much the students learn of practical or scientific agriculture, we cannot say. About a year since we heard of some difficulty between the students and officers in regard to provisions provided for their consumption.

THE NEW YORK STATE AGRICULTURAL COLLEGE was incorporated in 1853. Its creation was principally due to the energy of the late lamented JOHN DELAFIELD, who was chosen its first President. After his death, the work was suspended. It was revived in 1856. The farm, embracing 680 acres, was then purchased at a cost of \$45,000, principally by subscriptions of the farmers of Seneca County. It is situated on an eligible and commanding position, stretching from the village of Ovid to Seneca Lake. A loan by the State of \$40,000, for twenty years without interest, is secured on 400 acres of the estate. The Trustees have contracted for the erection of a portion of the main College building, to be completed in one year, for the accommodation of 125 to 150 students. Its available funds for this purpose, now consist of \$35,000. When this institution will be ready for students, or how desirable will be facilities for education we cannot say. We fear the prospects are not very encouraging.

THE PEOPLE'S COLLEGE at Havana, Schuylar County, in this State, was incorporated in 1857. Its Charter contemplates a capital of \$250,000, which may be increased to \$500,000, of which enough has been already subscribed to encourage the belief that the experiment will be fairly tested. The corner stone of the main edifice was laid on the second day of September last, and the Trustees announce their intention of opening the Institution next autumn. It should perhaps be designated as an Industrial, rather than Agricultural College, for it embraces various kinds of manual labor in its plan, while the term consists of but 200 acres of land. Labor is to be compulsory on both teacher and student, a plan, if successful, admirably adapted to prepare a new class of Professors, such as new Institutions of the age will demand. It contemplates a wide range of study, as, less, in the language of its Charter, than "Literature, Science, Arts and Agriculture." From the well known ability and energy of the Directors of this Institution we have great hopes of its success.

THE FARMERS' HIGH SCHOOL OF PENNSYLVANIA was incorporated in 1855. It is located nine miles south-west of Bellefonte, in Centre County, on 200 acres of land, the munificent gift of Gen. JAMES IRVIN. The farm, to which 200 acres have been added by purchase, is being brought rapidly into a high state of cultivation. Its resources consist of \$10,000 donated by the State Agricultural So-

cety, \$10,000 subscribed by the citizens of Centre County, \$5,000, a bequest of ELLIOTT CRESSON, and \$25,000 appropriated by the State. The further sum of \$25,000 has been appropriated by the State on condition that an equal sum be subscribed by citizens. Its whole means, therefore, if the subscription is completed, of which no doubt remains, are \$100,000, and the farm donated by Gen. IRVIN, at \$12,000. One wing of the main College building is nearly erected, and the present design of the Trustees is to open the Institution on the 15th of February next, with 100 students, to be increased to 400.

THE MARYLAND AGRICULTURAL COLLEGE was incorporated by the State in 1856, and \$6,000 per annum appropriated towards its support provided subscriptions to the amount of \$50,000 were first secured. That object having been effected during the last winter, the Institution was organized and the College located on a tract of 428 acres of land, purchased at Bladensburg, near Washington, from the estate of Hon. C. B. CALVERT, the largest Stockholder and President of the Board of Trustees. The corner stone of an extensive edifice was laid on the 24th of August last, and the design is to push the work to rapid conclusion.

THE STATE AGRICULTURAL COLLEGE OF IOWA was incorporated in March last. The preliminary appropriations are \$10,000, and five sections of lands heretofore granted by Congress for erection of Capital buildings. Localities vie with each other in offers of money or land to secure its location, varying in value from \$10,000 to \$25,000. It is to be fully organized and located in January next.

THE MINNESOTA AGRICULTURAL COLLEGE was incorporated during the present year. It is located at Glencoe, McLeod County. The farm consists at present of 320 acres of land. Its design, scope, and principal features, as well as that of the Iowa College, closely resemble those of the Agricultural College of Michigan.

The Agricultural Colleges of Michigan, Iowa and Minnesota, are State Institutions. Those of New York, Pennsylvania and Maryland, are the joint works of public spirited individuals and the respective States.

In anticipation of all these efforts, the Farmers' College near Cincinnati, Ohio, under the auspices of F. G. CARY, Esq., and other public spirited gentlemen, has for several years promoted the cultivation of the earth in conjunction with literary and scientific pursuits. It is, however, a Classical Institution, embracing other objects, and prescribed labor in the culture of the soil, is not a compulsory feature of its plan.

A bill establishing an Agricultural College is now pending before the Legislature of Ohio, and will probably be reached at its adjourned session, the approaching winter. Its friends are not sanguine of its success.

The Legislature of Massachusetts, in 1856, incorporated a School of Agriculture, which must be dependent entirely on subscriptions for its future establishment. In 1850, Massachusetts, in advance of other States, appointed Commissioners to investigate the subject, and Prof. HYDECOCK made an elaborate Report relative to Agricultural Colleges in Europe. A plan was recommended for Agricultural Education, but no effective action was taken on the subject. Two citizens of Massachusetts, BENJAMIN BERRY, of Roxbury, and OLIVER SMITH, of Hatfield, have made princely bequests to be used in some remote future contingencies for founding Agricultural Colleges, but available for no immediate use.

Efforts are being made to establish Agricultural Colleges also in Virginia, South Carolina, Alabama and Wisconsin.

Agricultural Professorships have been endowed in the Universities of Virginia and Georgia, by public spirited individuals, and also exist in several other of the Classical Colleges of the country. In Michigan the University has such a Professorship. Scientific Schools of an elevated character, have been connected with many of the older Institutions.

Here we have given, on the authority before mentioned, a catalogue of the Agricultural Schools in operation, as well as those of which we may have reasonable hopes. Young men can thus judge for themselves of the prospects of obtaining a scientific agricultural education through any of these institutions. The great drawback to the efficiency of these schools, supposing them to be sufficiently well endowed, is competent teachers.—Professors of the Natural Sciences can be obtained without difficulty, but who among all our learned men have studied the Sciences with reference to their application to Agriculture? Who among our good, practical farmers are so pre eminently good as to be competent to act as models and directors for the young?

Our advice to young men thirsting for knowledge on this subject is, study Chemistry, Geology, Entomology, Animal and Vegetable Physiology, and other sciences of service to the farmer, in schools or academies, or at home—anywhere that the

knowledge can be obtained with the greatest facility; study the best English books, such as *Boussingault's Rural Economy*, *Johnston's Agricultural Chemistry*, *Cyclopedia of Agriculture*, &c., &c., read the American Agricultural Journals, for the experience of the best farmers; and in this way you will gain a vast amount of just the knowledge you will need. Test every theory, as far as possible, by practice, and in this way not only will their truth or falsity be made manifest, but the facts will be indelibly impressed upon the mind. Watch closely the practice of good cultivators, and you will see much to imitate and some things to avoid. Do this, and you will make good practical farmers, with as good a claim to be scientific as those who boast their science, though you may never enter an Agricultural College.

PRACTICAL NOTES.

Waste Manures.

An agriculturist once wrote, "men have explored the caves of India, the battle fields of Europe, and the coasts of Africa, for the elements of fertility; yet upon our own farms, in adjoining workshops, or in neighboring towns, are to be found not one, but many sources from which fertilizers may be obtained. How many corners in his own farm afford the farmer the vegetable and mineral constituents of useful composts—how many clays and marl beds, that would remedy the physical imperfections of the sandy surface, are permitted to remain in shapeless and useless idleness—how many masses of materials that have served the purposes of trade or manufacture, remain in the nooks and corners of towns, idle for all the purposes of the farmer, by whom they are capable of being made, in many instances, valuable agents of fertility." This is true, and a glance at some of these sources of fertility lying or running waste, may not be unprofitable. The drainage from the stables is of the first importance, and an earnest effort should be made for its preservation. Perhaps next in importance to this is the drainage from manure heaps, as this waste is composed not only of the urine, but a solution of the richest part of the dung. The drainage from the house can very easily be preserved, by a proper arrangement, and if not convenient to use in a liquid form, may be thrown over the compost heap, and it would be well were it formed principally of turf or dry muck. Such a compost would be an excellent place to throw all blood and animal matter, at killing time, while weeds and vegetable refuse would decay quicker if composted with stable manure. A compost of rotten turf saturated with soap-suds and other slops and refuse from the house, is a regular guano heap. A farmer who saw a neighbor cutting a drain from his yard, to carry off the drainage of his house and sheds, reported around that he observed his neighbor cutting a hole in his pocket!

Those who live near a town, can pick up a large amount of the very best kind of manure, by keeping an eye open. The finest pile of manure that we ever owned, was made of the sweepings of a blacksmith's shop. At one time we observed workmen pulling down an old livery stable, to put up stores in its place. The soil beneath the floor had been saturated with liquid manure for more than a score of years. We found the person who had the contract for digging the cellar, and engaged the surface soil eighteen inches deep, at twenty-five cents a load, and would like to get a similar chance at one dollar. About the best field of wheat we ever saw, belonged to a comb-maker, who had used the horn-shavings for manure. One of the most effective manures we ever used, was the refuse from a woolen factory. Many of these and others which we have not mentioned, the farmer who is constantly on the look out for fertilizing materials, can obtain at a very cheap rate.

Bedding to Save Liquid Manure.

Perhaps the best bedding for this purpose is dried muck from swamps. Saw-dust is good, tho' the saw-dust most easily obtained is of a resinous nature, and of slow decomposition. The liquid manure will hasten its decay. In this city saw-dust is used to some extent by keepers of horses, for its economy and cleanness alone. According to BOUSSINGAULT, 260 pounds of pine saw-dust contains as much nitrogen as 100 pounds of common stable manure.

Fowl Manure.

No manure obtained by the farmer is as valuable as the manure from the poultry house. Of this there is no question, and yet we can hardly answer the question "in what way is it best to use it?" This manure is made only in small quantities, and it may be true, that as a general thing much of it is wasted. It may be thrown with other manure, muck and refuse on the compost heap, but our plan is to save it for special purposes, and we generally use it in the vegetable garden, where it is not only valuable, but exceedingly convenient. When dry, it may be sown with onion or other seeds in the drills, at planting

WILLARD'S IMPROVED VEGETABLE CUTTER.

THIS machine has been in use two or three years, and is commended by those who have used it, as admirably adapted for cutting up turnips, beets, carrots, potatoes, and other roots, pumpkins, &c. for stock. We have not seen it in operation, but are assured that it is simple, that a man can cut two bushels of roots per minute, and that it cuts sufficiently fine for young lambs and calves—not slicing the roots, but leaving them in small broken

pieces, so as to prevent choking. It also leaves them in the best condition for mixing with meal, bran, or cut hay and straw. We are inclined to believe it is a very valuable machine for stock raisers, and presume the manufacturer, if as shrewd as most Vermonters, will ere long announce the price, (which we think is only \$10), and where it may be obtained. It should be on sale at the Ag. Warehouses throughout the country.

time, and four or five quarts put into a barrel of rain water makes a most superb liquid manure for any beds of young plants that need stimulating. In this form we use it for our melons and cucumbers, as soon as they appear above ground, to put them out of the way of the "bugs," and on beds of cabbage, cauliflower plants, &c. for the same purpose. Celery plants after being set out in the trenches may be hurried up amazingly by being watered two or three times a week with this liquid food. If magnificent sweet corn is wanted, half a pint of the dry hen dung, finely scattered in each hill, will give it, and no mistake. If you have been able to grow only hard, hot, wormy radishes, next spring sow the seed in very shallow drills, (not too early) in a warm, sheltered place, then cover the bed with a thin dressing of coal ashes, and water with the liquid hen manure each alternate night, and if the season is as favorable as ordinary, you will have no cause to repent the trial. A little charcoal dust is better than coal ashes.

EDUCATION OF THE HANDS.

SOME time since the RURAL related the doings of two young men who husked one hundred bushels of corn each, from six o'clock in the morning to six o'clock in the evening, having their dinners brought to them in the lot—they invite competition. My father tells about his cousin in Old Connecticut, who husked eighty bushels of corn in a day—but I suppose in this matter we are not to bid down as they do when they take contracts on the public works,—if that was the game, I could tell of several remarkably small days' works done by my month hands. Mr. GORRAN, my neighbor, tells me a story on the other side of the question. A young man, WARREN ALLEN, husked one hundred bushels of corn from seven o'clock in the morning to six in the evening, and on the succeeding day, JEFFERSON DEAPER husked one hundred and five bushels in the same time. The corn was cut up at the roots and set up in stooks, binding round the tops, and mostly of the Dent variety—the huskers, in both cases, went about one-fourth of a mile to dinner, husking only about ten hours. The work was fairly done, Mr. GORRAN measured the corn and certifies to the facts.

So remarkable a feat, it seems to me, ought not to be unprereached from. Our subject naturally divides itself into two heads:

First, A man can do a great deal if he tries.

Second, If he knows how.

If he tries! How many useless, half-waking, half-sleeping, half-working, half-playing, half-mov-ing, half-resting, half-thinking, half-dreaming operations occur in this life-time of ours. What's in a purpose? A fortune—a kingdom—a character, even! To resolve, to really resolve, is to do! A man sometimes thinks he has made up his mind when he hasn't. He mistakes desires for determination—a purpose implies possibility and means. How can a sane man attempt what is utterly unattainable?

Touching every-day business, who has not

observed how much more some people accomplish than others of equal powers and attainments. It is with men as with horses and oxen,—the amount of work done depends on the gait, and that depends on habit and education. One of the best ox teamsters I ever knew, EZEKIEL WARREN, would not drive steers in the same team with dull, lazy oxen, which somebody else had spoiled—his oxen never were slow, for he made them "walk up," on the start, and all through.

Of course, neither men nor oxen can go fast for a great length of time—then rest when it is necessary. Fatigue may frequently be avoided by varying one's work, doing something else for a while, and this without detriment to one's business. If the apple trees are to be trimmed, and the carrots to be weeded, let that mix in with heavy work. Instead of splitting rails all of one day, and plowing all of the next, it might be better for man and team to split half a day, and then plow half a day. These remarks are aimed, however, at moping and dawdling without reason and without necessity.

Secondly, Much depends upon knowing how. In other branches of business, men and boys are not expected to understand a thing before they learn it; but in farming, if your father is a farmer, so called, and you are born on a farm and live there, there is nothing to be said about it—you are a farmer by "divine right," qualified for anything and everything in your line of business! Seriously and soberly, our boys go to work, and work on without systematic and competent instruction in any branch of business,—they chop, and mow, and plow, without being choppers, mowers, or plowmen—they neither work up faces at me—I tell you plainly you ain't the first rational idea about what an educated hand (palm and fingers) can do.—You have heard about "sleight of hand," and you think it means spirit rapping, or mesmerism, or some other mystery,—it is simply knowledge, dexterity and agility, which should characterize every move we make and every act we perform.

Peeking round once in the city of New York to see what I could see, I strayed into the Post-Office, and there saw a man assorting letters,—he had a large number of small boxes before him, the most distant of which were several feet from him. He took up what he could with one hand, then with the other took a single letter, glanced at it, and, quick as thought, pitched it, quail fashion, into the right box, (I suppose,—) he did not seem to follow the letter with his eye to see that it went right, but instantly let another go in the same way. Had I attempted to do that thing half as fast, I'll be bound that somebody would 'nt have got letters by "return mail."

The point and moral of all this is, that we should devote more time and more care to acquire skill and expertness in the several departments of farm labor. I have seen a man mow a swath handsomely with less than half the expenditure of strength which the next man used who didn't cut half as smooth. I have seen a man expend more in binding one acre of grain than another would in binding two. I have seen a take more time, and

pass through more tribulation in chopping one cord of wood, than B did in cutting three. I have seen a skillful plowman as much at ease at his plow-handle as a government officer on duty, while a novice would pull, and push, and twist, and wriggle himself into a sweat and a passion with a miserable show of work performed.

I assert that men of experience will hardly deny, that taking farm laborers together, they lose one-quarter of their time, and waste one-quarter of their strength. If this is so, it is the most frightful waste conceivable! The burning up of one-half of the cities and villages on the globe every ten years would be a smaller calamity. With, perhaps, the single exception of the tread-mill, there is no operation, however simple, but requires skill in its performance. Take, for instance, the picking up of a stone. Is it simply a question of back bone? Can two men of equal strength lift the same stone? Not at all. In the first place it is to be put in an eligible position—turn it up on its longest horn, if it has any, and on the highest clod—the first three or four inches is the hardest to raise)—so by getting its centre of gravity a little up you gain something; then get hold of it where you will have to exert the muscles of your hands and arms the least to hold on to. Don't bend over like a half-circle, but squat—then, by a dexterous use of your knees, you can render essential aid to your spine—expect that you can lift the stone—lift it! Emphatically, skill and determination perform the wonders of this life.

We are here in almost the crudest imaginable condition, with next to no knowledge of our capabilities. I wish Mr. Moore would publish some of the wonders performed by the deaf, dumb, and blind girl, LAURA BRIDGMAN, and others, who, being forced to cultivate and depend upon some particular faculty, have, in some degree, illustrated what those faculties can do with cultivation. It was very common for LAURA BRIDGMAN, when one of a numerous company would hand her a piece of money or an article of clothing, to return it to the owner, though totally blind—by the same means, probably, that the dog distinguishes the track of his master.

When I said that one-fourth of the time and strength of farm laborers—employers as well as employed—is actually thrown away and wasted, I intended to speak within bounds, and as evidence that I did, I will mention that a man in Moscow, N. Y., has repeatedly cut an acre of heavy corn in three hours, setting it up and binding it round the tops, and he has cut, set up, and bound, from two and a half to three acres in a day. I need not say that he proceeds on a well-devised plan. One acre is considered a fair day's work.

I call attention to these things from a deep conviction that time is more than money.—H. T. B.

BEES AND BEE-HIVES.

MY EXPERIENCE—NO. IX.

I HAD kept bees for twenty-five years, and studied constantly to make them profitable—looked at every measure that would give the best returns for the money and labor expended. I could not discover a single advantage, or one new principle that would pay any extra expense over the simple box hive. I had succeeded with that, and few apiarists had kept more bees, or kept them longer than myself. Among all the bee-keepers that I could find, those using the simple box were the only ones extensively engaged in their culture. Thousands had failed with the patents. Believing on such authority that the simple box was safest, cheapest and best, I wrote the work "Mysteries of Bee Keeping Explained," and recommended no other hive. As all the works on bee-culture in this country, had evidently been written to puff some patent, it created some little astonishment in an eminent publisher, who asked if I "could not get up something to make it go." Had I been less scrupulous I think I might; and very likely would have gained a few dollars by it.

To test the sincerity of many patent vendors that boasted of such splendid results, I offered a "Premium for the best Bee Hive." That appeared in the *Dollar Newspaper*, Pennsylvania, and the *American Agriculturist*, New York, 1854. The following were some of the conditions:—That the hive must be furnished, ready made, and myself subjected to no loss if it failed to equal mine, &c. I was to test its merits beside those of my own make, and not trust to the interested statements, when one swarm was contrasted with another half its size, or one in a locality almost barren with another yielding honey in abundance. The swarms were to be introduced at one time, and of one size, the proceeds faithfully recorded, and at the end of two years report the result. If said hive exceeded mine in profits only twenty-five cents, annually, I would pay for the privilege of using, five times the price of right, besides I promised to make the result public—an item worth something. I endeavored to have the offer as favorable for them as possible, but I did not care about suffering loss, for the sake of trying their notions. No one offered a hive. Were they afraid of risking the result by the side of a simple box?

Two years afterwards, (1855,) the Rev. L. L. LANCASTER brought to me his model comb hive, with a request to test it, and report the result. I saw at once that by controlling the combs, and consequently being enabled to inspect the interior of the hive at all times, was something not offered by the common hive. He enumerated over fifty advantages that his hive gave over the common one. Although I could not discover quite so many, yet I thought I could see enough to pay me, at least, for the extra expense of construction.—Near the first of May I transferred the bees, combs, honey, &c., of some half dozen hives, into the frame. I did not expect, neither could I discover, that the bees worked "more vigorously than before," but they worked well, however; some swarmed naturally, others I made to swarm artificially, and second swarms were prevented effectually. In Nov. I made nearly 100 hives on this principle, and put bees into them, which worked quite satisfactorily. The present summer, 1858, I have used a large number. But a difficulty has arisen that I was not prepared for, viz., crooked combs. Last year, among the whole number, there was but one hive of them so crooked that they could not be taken out, yet there were a great many of them not perfectly straight. This year

two thirds of the swarms that have been put into empty hives, have made combs in every possible direction, without regard to the bars, making them, so far as moveable frames are concerned, no better than the common hive. The cause of this I have not been fully able to determine. Last year the bees gathered honey very slowly, this year very fast; probably this has some effect—a little more experience will decide. Last season I had a great many combs made with but little or no honey stored in them, this season I have used them for new swarms, putting two or three in a hive—two or more empty frames between those with combs. Even here, although they have followed the frames with their combs, some places are so very thick, and others so thin that it is extremely difficult to raise them out. I did not expect to find these difficulties with this hive. A few weeks ago—before the present swarming season—I should have told the story somewhat differently. Even now, with all the uncertainty of the directions in which the combs are built, there is a class of bee-keepers who may make this hive pay—such combs as are not built straight, can be made so by the fearless operator. But the bee-keeper who has not the energy to prepare himself to take off the top of his hive, and open the door for thousands of perhaps angry assailants to attack him; and the ignorant one, so totally unacquainted with the nature of the bee, that he could not tell what he wanted to take out the combs for, had better adhere to the common hive, because without making the frames available as intended, they are worse than useless, also money and labor thrown away. The man who has not much time or patience to beatow on his bees, that pays for a patent, wants it to work right at all times, without depending on the caprice of the bees. And when those interested in the moveable frames can improve this patent with a plan that will make straight combs in all cases, (with some other minor improvements,) it will do much better for the common bee-keeper. St. Johnsville, N. Y., 1858. M. QUINBY.

AN IOWA LETTER.

EDS. RURAL:—Thinking that a few lines from this part of Iowa will be acceptable, I write for the purpose of giving some information to the many readers of your valuable paper.

This portion of Iowa is rich and fertile, mostly rolling prairie, interspersed with timber along the streams. The timber consists of white, red, black, and burr oak, red and white elm, linden, hickory, walnut and birch. The prairie soil is rich, varying from one to five feet deep of a black loam—along the stream bottoms, sandy. The prairies are covered with grass, which grows rapidly as soon as the earth is free from frost in the spring, and serves well as pasture for the flocks in summer—when out and harvested, makes good hay for winter use. The soil is well adapted to the raising of all grain common to the Western States; in corn it excels, and this is the principal crop with the farmers. The farmers here have been much engaged in the raising of hogs, but since the "Hog Law" came into effect, the business has been partly reduced, the hogs being prohibited from running at large, and consequently it costs more to raise them. The "Hog Law," as it is termed, was passed about four years ago in this county, by a majority of the voters prohibiting hogs and sheep from running at large, consequently it became necessary to build tight fences, such as would keep cattle and horses from trespassing.—The manner of building is three rails, or boards, nailed to posts, the upper rail four feet and a half high, and the lower one foot and a half from the ground. These fences are very common in Iowa, Illinois, and Missouri, and are undoubtedly a great benefit to the Prairie States, where timber is scarce and of a scrubby quality, as it takes no more than one-half as much to build a fence.

This section is very healthy. On the upland prairies we have, in summer, always a nice breeze, and in winter a cold, severe, piercing wind—on the lowland bottoms, near streams and ponds of standing water, it is unhealthy, especially in the fall of the year, when people are much subject to bilious diseases. One great cause of unhealthiness in the West is the drinking of bad water. Many folks here take water for family use from the creeks and ponds. Those who live on upland prairies, and drink good water, are as healthy and robust as the people who live in the New England or Middle States. W. B. Iowa City, Iowa, 1858.

PROFITS OF BEE-KEEPING.

In your issue of the 27th ult., we have an article on the profits of bee-keeping, from EUGENE LEWIS, Reeds Corners, N. Y. He says he wintered over sixty-nine swarms, and from these he takes the past summer, 2,535 lbs. of pure box honey, almost 37 lbs. to the swarm, an average amounting to \$360, 25, and he gets twenty good young swarms, worth \$5 each, added to the above, gives him a little over \$480. Well, had he made a full stop at this point, he would not have been so likely to have led any one into visionary speculations, especially the inexperienced. But he then says it was a poor season for swarming, and also for making honey. After he has got about the interest of \$100 on each swarm, the impression is still left upon the mind that a good season will do a great deal better. Now, in order to set all right in the matter, Mr. LEWIS wants to set down and give a true statement, thro' the RURAL of the past ten years, if he has kept bees that length of time, and give the profits of each year, as near as possible—failures, if any, as well as triumphs—and let the public know how much better he has done the former good seasons, than the last poor one. The public have a right to this, and we hope all will remain passive until the statement appears, and not run into any visionary speculations. There is a difference in localities as to bee pasturage, and Mr. LEWIS may be favorably situated. We want him to state whether his bees got anything but what they obtained in nature's garden or bee pasturage the past season, and also how he winters them. A SUBSCRIBER. Roma, N. Y., 1858.

A BREEDING SOW.—Will some of your readers be so kind as to inform me what treatment will be likely to restore a fine breeding sow that is disabled by weakness in the loin, thrifty and strong otherwise?—A. T., Miller's Tavern, Va., 1858.

FARMING IN ILLINOIS.

EDS. RURAL:—By favor of a brother, residing in Victor, in your State, I have been in weekly receipt of the RURAL for nearly a year, and I assure you that I am much pleased with its perusal; and although its suggestions in regard to farming may be said to be more immediately applicable to your own State, yet, by slight variation in some instances, they prove exceedingly useful to the farmers of our own Prairie State. It is looked upon here as the leading Agricultural Journal of the country, and I prize it the more as it emanates from the home of my youth.

I have resided in this country for the last twenty-five years, and have found from my own experience and observation that the system of farming has to be varied to meet the change of climate and soil of the country, and the circumstances of those engaged in that pursuit. Our winters here are usually more severe than they are at the East, as our country is more open; the wind showing no mercy in many localities. The fall of snow is generally light. Our soil on the Prairies is mostly black loam, and on such soil we do not always succeed in raising good crops of winter wheat. Little snow and much freezing and thawing during the winter, causes it to heave. On our clay soil, (timber lands), we raise good wheat.

For several years after I came to this State our great product was oats, and as we succeeded in raising great crops, and found a ready market, we went on sowing oats after oats, apparently thinking that Illinois soil could not be run. But we have seen the folly of such a course, and have turned our attention more to the growing of corn and stock, for which we find the country well adapted. As a stock growing State we defy the world. You will see by reference to the Reports of the Cattle Markets of New York that Illinois usually takes the lead in numbers and quality, and this is in addition to the enormous quantity packed at home.

Of our crops the past season I have nothing very encouraging to note. Our oat crop has proved a failure more complete than in any year for the past twenty five; corn is a very fair crop; potatoes poor. The corn and potato crops were very much injured in some localities by the white grub. They appeared in great numbers in the month of July, eating the potatoes badly, and in some instances killing the corn. They also injured our meadows very much; but they have all disappeared, and some believe that they have "taken to themselves wings and flown away."

In regard to fruit culture I can say that there is no part of the world where the apple and peach trees grow more thrifty than here; and if we can succeed in protecting them from the severity of our winters, we can raise fruit here as well as anywhere. We wait for the good time coming. If there is anything I miss in this, the home of my adoption, it is the old Pittsford orchard. The suggestions in the RURAL, in regard to the cultivation of fruit, I think might be carried out to advantage here. My better half says that she considers your column of *Household Recipes* worth the price of the paper. So you see that the RURAL must come right along. Homer, Will Co., Ill. A. G. R.

EXPERIMENTS WITH POTATOES.

EDS. RURAL:—I procured a few sweet potato plants last spring and set them out, (by the by they succeeded well and gave a good yield of very fair sweet potatoes), but the weather being unfavorable, some of them died, and as a lot of common potatoes had come up about the garden, the thought occurred to me to try raising them from sprouts, the same as sweet potatoes. I accordingly dug some of them up, pulled off the sprouts and set one in a place where the others were missing.—They grew vigorously, making large hills, and gave a fair yield of as fine potatoes as I ever saw. I did not dig them until the sweet potatoes were ripe, and do not know whether they were earlier than potatoes planted at the same time, in the usual method. Who knows that, by starting them in a hot-bed, this would not be the best way to get early potatoes? Who will try the experiment, and state the result? Don't plant a field, though, in this way, till you have tried a few in the garden, for they might not succeed next year. R. B. W. Alabama, N. Y., Dec., 1858.

EXPERIMENTS WITH POTATOES.—Of two varieties of potatoes, (the *Dover* and *Prince Albert*; an equal quantity of each) I planted only just sufficient for my own table. They were put in the ground the 14th May, single eyes, in drills, with a pretty fair allowance of Poudreite (N. Y. manufacture) for manure—the only kind then conveniently to be obtained—an article very much over praised and over paid for. They were gathered early in October, the result being as satisfactory as I had any reason to expect. Of the *Prince Alberts* a single one only was found rotten, and this was in a state of active fermentation, as much so as any dough ever seen in the bread-trough. Indeed, it more resembled thick yeast than anything else, as the mass flowed quite freely, if the potato was turned on one side. The same circumstance I have often noticed (with other varieties, the *Mercer*, for instance), in previous years, as well also in Ruta Baga Turnips, where best, unfermented dung had been applied. A dozen (or more) of the *Dovers* were in various stages of decay, but none had proceeded so far as the single *Prince Albert*. A very limited number (less than a dozen) of the vines prematurely wilted, and as far as a very cursory examination permitted, there was no appearance of any fly. Herewith you have a small portion of one of the *Dovers*—the only one in the entire parcel the exterior of which bears any resemblance to the drawings in the RURAL, furnished by Mr. HENDERSON. You will see that this is rather decay than rot, as the potato is now nearly a dry, spongy mass, no moisture being visible. If his theory is correct, how comes it that but one potato out of five bushels is thus peculiarly affected? A. W.

A FARMER'S ICE HOUSE.—Please publish in next number a plan for an ice house for a farmer.—SUBSCRIBER, Huron Co., Ohio, Dec., 1858.

REMARKS.—See RURAL of Dec. 4, page 390; also of Nov. 13, page 365.

INQUIRIES AND ANSWERS.

PLAN WANTED FOR A LARGE FOWL HOUSE.—Will some of your numerous correspondents give through the RURAL some good plan for erecting a henry sufficiently large to hold two thousand hens; and the different kinds of food that is necessary to feed them in order to get the greatest quantity of eggs? The profit also arising from keeping hens, &c.—W. B. O., South Bend, Ind., Dec., 1858.

WIRE TOOTH HORSE RAKE.—Can you inform us through the columns of the RURAL who has the patent right for Wire Spring Horse Rakes, either with or without wheels. We have seen a cheap kind, costing about \$6, but can't learn where they are to be obtained, or of whom to procure the right to make one.—SAMUEL, North's Mills, Pa., 1858.

REMARKS.—The agent of the RURAL in Canada, daigra, N. Y., JAMES S. COOPER, manufactures them, and, we believe, is the patentee.

TO MAKE BUTTER COME.—As you seem to be the man that helps everybody out of difficulty, can you tell us how to make butter come without churning two mortal long hours for it? If you can, and will, you will oblige one that hates to churn.—D. ALLEGAN, Dec., 1858.

REMARKS.—The only reason your butter does not "come," is, that you do not have the cream of the right temperature. About 55° is right for the cream when placed in the churn, and the process of churning will raise the temperature from five to ten degrees. For further information see "Facts About Milk," in the RURAL of June 12, page 180.

CRIMSON CLOVER.—Will you please inform me through the columns of the "RURAL" what *Crimson Clover* is? The seed resembles white moward in size and color. The leaf looks very much like our common red clover when first up. I would like to know its nature, and whether it is intended for fodder or as a flowering annual only. I received a package of the seed from the Patent Office without any directions for sowing or anything pertaining to it more than name.—H. A. WHITMORE, Fluvanna, N. Y., Dec., 1858.

REMARKS.—The only varieties of clover we know of that bear any resemblance in name to that mentioned by our correspondent, is the *Italian*, or *Crimson Clover*, and the *Late Flowering Crimson Clover*. The former has long been an object of field culture in the South of Europe, but though enumerated by early horticultural writers among the most beautiful border plants, it was only introduced into Great Britain as an agricultural plant about the year 1834. Since that time it has been pretty extensively cultivated, particularly in the southern counties of England, where we have seen it growing in perfection. It is generally sown on stubble, immediately after the removal of the wheat, and in light land the only preparation is dragging, just sufficient to cover the seed. On stiff, clay soils, shallow plowing is sometimes resorted to. The young plants are, however, supposed to stand the winter better without plowing. It is usefully employed in "thickening up" blanks in grass and clover fields. It does not succeed well in Scotland, nor do we think it would be suited to our climate. We presume this is the *Crimson Clover* introduced by the managers of the Patent Office.

The *Late Flowering Crimson Clover* is described in the *British Cyclopaedia of Agriculture* as a French variety, that was first brought into notice in 1835, and introduced into England in 1857. It comes into flower when the blooming of the other varieties is about over, and the yield per acre is represented as about a third more than of most other varieties.

Rural Miscellany.

THE RURAL'S PREMIUM PLANS FOR FARM BUILDINGS, are, after much difficulty, nearly ready to be given to its readers. The Committee appointed to make the awards on HOUSES, have finally completed their arduous labors, made their report, and the prize plans are in the hands of our engraver. The Committee on BARNS have agreed to complete their examination the present week, so that we shall probably be able to give a full report, and one or more of the premium plans, in the first number of our new volume. Many of the designs to which premiums have not been awarded possess some creditable features and considerable merit, and all will no doubt receive due acknowledgment in the reports. It is proper to add, in explanation to competitors, and readers, that the large number of plans offered rendered it difficult to make satisfactory examinations and awards, and has caused a greater delay than was anticipated. The original intention of our offers will, however, be fully carried out, and we trust to the entire satisfaction of competitors and others interested.—The plans will prove a valuable feature of our next volume, and no doubt be worth, to many of our readers, far more than the subscription price of the RURAL.

WESTERN MARKET REPORTS.—An Illinois correspondent suggests that it would add greatly to the interest and value of the RURAL, so far as its numerous Western readers are concerned, were we to give reports of the Chicago Grain Market. The suggestion is a good one; previous to its receipt, however, we had considered the matter and concluded to give, in our next volume, reports of the Chicago, Cincinnati and perhaps other principal Western Markets. Special pains will be taken to keep our readers advised as to the condition of the principal Grain and Provision Markets, both domestic and foreign. Our endeavor will be to give as accurate and late reports as possible.

BRUISED GRAIN FOR HORSES.—MR. CHALIER, one of the Veterinary Surgeons employed by the Compagnie des Voitures de Paris, has written a letter to the *Constitutionnel*, in which he states the results of his own experience as regards the English system of feeding horses with bruised oats and barley. It appears from his observations that these kinds of grain ought not, when bruised, to be given alone; the horses eat the mixture too greedily they do not chew it sufficiently, and the consequence is that it is not well digested. But when the feed of bruised grain is well mixed with that of chopped hay, the horses are equally fond of it; they then chew it well, incorporate it in the saliva, and the digestion is therefore perfect. But care must be had not to diminish the ration too soon; nor should barley be substituted too suddenly for oats, the former being less easily digested than the latter; otherwise the horses grow lean, and lose their strength.

KETCHUM'S HARVESTER.—Prizes Awarded.—It will be remembered by most of our readers that Maj. R. L. HOWARD, the liberal proprietor and manufacturer of KETCHUM'S Harvester, last summer offered several handsome premiums to those using said machine. The prizes were offered for the best and greatest amount of work performed in the shortest time, and at the least expense for repairs—the object being to advise and satisfy the community of the capacity and durability of the KETCHUM machine—and the result is highly creditable to both the machine and the competitor. The first premium, of \$150, was awarded to HORACE LATHROP, of Pittsfield, Washtenaw Co., Mich., who cut 75 acres of grass in 80 hours, the expense of repairs in 47 hours, without any expense for repairs. The second premium, of \$100, was awarded to I. G. LELAND, of Northfield, Wash. Co., Mich., for cutting 50 acres of grass in 50 hours, and 72 acres of grain in 50 hours, with an expense of only 80 cents for repairs. The third prize, of \$100, to DANIEL COX, of Middlebury, Wyoming Co., N. Y., who cut 113 acres of grass in 58 hours, the expense of repairs being \$108. The fourth prize, of \$50, to C. C. LAWIN, of Fairfield, Huron Co., O., for having cut 80 acres of grass (yielding 2½ tons to the acre) in 46 hours, without any expense for repairs.

—These facts are quite remarkable, and show the great importance of these machines to the farmer. We are informed that many other competitors have furnished proofs of nearly as astonishing performances. In every case affidavits were furnished to a disinterested person, who carefully compared and considered them and made the awards—which have all been paid. We understand that Maj. HOWARD intends to increase the list for the next harvest, and presume many of our readers will, in due time, enter the arena of competition.

OUR PORTRAIT.—An occasional correspondent and ardent friend of the RURAL, residing in Western Penn., writes:—"I would like to see your portrait, Mr. Editor, in the RURAL, and I think almost all your readers would. Do please us in this way. Can't you have it ready for the first number in 1859? Do try."

—This, and similar requests heretofore, toucheth our appreciativeness, and, with wool "beaver" in hand, we "make our manners" in acknowledgment. But, really, our friends must "wait a little longer," if not a long time—for, though not over young, our youthful (we will not say green or verdant) appearance, (and the lack of silver-grey-dom,) is so commonly remarked whenever we attend Fairs, &c., that even if we possessed sufficient merit to warrant the exposure, we doubt the propriety of going into the picture. When we get the 100,000 RURAL subscribers, and sufficient age and dignity, perhaps it may answer. It would not do now, at all, for (aside from the above and other cogent reasons) recent illness has made us so much worse looking than usual, that a portrait would indeed prove a counterfeit presentment!—Excuse us, friends!

HAY CUTTERS, &c.—(T. B. Alfred, N. Y.)—We think it pays to cut feed. A good cutter can be had at any of the implement stores for from nine to twenty-eight dollars, the largest sizes being intended for horse-powers. We think it beneficial to blanket a horse if he is well treated in all respects. But, if the horse is to be treated badly, perhaps it would be better not to use the blanket in the stable. For instance, we have known owners very careful to charge those having care of their horses to blanket them well in the stable; yet, after driving them sufficiently to produce perspiration, on a cold day, they would let them stand an hour in the street without blankets, or put them on so shoddily that they would fall off in a few minutes. What do farmers say to this question?

GOOD COWS.—At the United States Fair at Richmond, Va., Capt. STANBURY, of Maryland, exhibited a herd of twenty-one Devons, among which the cow "Matilda," was so beautiful that the ladies crowned her with a chaplet of flowers on leaving the grounds. She has given twenty quarts of milk per day, after calving, and never dried off without difficulty. JOSEPH YOUNG, of Chatham, Mass., has slaughtered a cow but a few weeks less than twenty years old, which had not calved since 1848, and had given milk regularly ever since that time, until a few weeks before being killed.

RANCID BUTTER.—A recent issue of HALL'S *Journal of Health*, gives the following recipe, which, if "all right," is certainly very valuable:—"To a pint of water add about thirty drops, that is, about half a teaspoonful, of liquor of chloride of lime; wash in this two and a half pounds of ineffectually rancid butter; when every particle of butter has come in contact with the water, let it stand an hour or two, then wash the butter well again in pure water; the butter is then left with the odor, taste, and sweetness of fresh butter."

N. H. JOURNAL OF AGRICULTURE.—Is the title of a neat looking and well filled folio paper commenced last week at Manchester, and designed to succeed the *Granite State Farmer*, recently discontinued. While we think the JOURNAL will deserve success, we doubt whether the farmers of N. H. will properly sustain it—judging from the fate of its predecessors. Published by GILMORE & MARTIN at \$1.50 per annum.

SPEAKER SCUDDER, Esq., of Cattaraugus Co., who, as his letter testifies, is among the most firm and influential friends of the RURAL, is entitled to grateful acknowledgments for past and proposed efforts in its support. In a recent letter he writes us as follows:—"I would like a few specimen copies of the RURAL to use in getting up a club. My regular numbers I keep for binding, of which I have now six bound volumes, and one for 1857 nearly ready for the binder. I can hardly appreciate the value of the RURAL until bound; still as a weekly visitor it stands at the head of my list of papers. I first became acquainted with the RURAL at the State Fair, at Rochester, in 1851, introduced it in this section in '52, and in '54 had a club of over 60. At every point where I got a few subscribers that year there has been a regular club since, and considerable competition for it, too. Last year another person got up the club here, who has now removed, and I propose making an effort in this and adjoining towns. Experience teaches me that a spare copy or two in my pocket secures the most ready and reliable help in getting up a club, and I therefore ask a few copies for our mutual benefit."

Orchard and Garden.

LAST WORDS FOR 1858

This is the last opportunity we shall have to speak to our horticultural readers until the first number of the volume for 1859. We will only say that with new type, a most beautiful horticultural heading and other improvements, we shall commence our work for the new year, under the most favorable circumstances for producing a paper that will please and profit all. Some of the very best Pomologists in the country will contribute to our columns, and no pains or expense will be spared to make the *RURAL* the best medium existing for gaining and disseminating horticultural knowledge. Every subject requiring it, will be fully and freely illustrated, with engravings of the first class. In this department last year, we gave about one hundred and fifty engravings, and in the coming year we shall do as well, — at least, we shall do all that a proper understanding of the subjects discussed or the interests of our readers require. With our immense circulation WEEKLY, we are doing a work for the Horticulture of the Country unequalled by any other HALF-A-DOZEN journals; and, we think, therefore, we have a claim upon the kind offices of all lovers of Fruits and Flowers, and with confidence call upon all disciples of FLORA and POMONA to aid us in extending the circulation and influence of a journal so well calculated for good, as it is at once a HAND BOOK for the FARM, the GARDEN, the ORCHARD, and the KITCHEN; a COMPANION for the FIRE SIDE and the PARLOR.

TREES—THEIR BEAUTY AND UTILITY, NO II

ONE of their greatest charms is the sweet music trees constantly afford. From the "little leaves" of TENNYSON, which, "laughing, clap their hands with glee," to the "far spreading wood" of the graver poet, where, "mighty winds make music not unlike the roar of Ocean in his winding caves," there is a perpetual hymn of nature sounding among the trees; sometimes sweet-voiced and low; at others, high and spirit-stirring; and not unfrequently, wild and sublime, as that of some lonely, mid-night oak, "when the storms in his branches shout." Amid the harsh and discordant noises with which our ears are pained in this age of steam-whistles and ponderous machinery, this violent forcing every where of material nature into the service of man, and which seem like wild screams and protests of inarticulate life, in being thus forced, how sweet it is to listen to that low, magical under tone which is perpetually murmuring wherever there is a tree, speaking of peace and rest, and calling the too anxious spirit away from the eager excitements of business, to calm and pure enjoyments.

Having indulged myself in a few rather fanciful reflections about trees, I shall now proceed to consider them in a more practical light. A tree can never be considered merely an article of use, until it is actually cut down. As long as it stands upon the earth, it must be viewed partly as an object of taste, and when it is used for convenience or ornament, reference should always be had to the peculiar characteristics of the tree, and of the place where it is to stand. Some people seem to think that if they plant a seed or a sapling, no matter where or of what kind, they have done their duty. Not at all. It is so easy to put the right thing in the right place, and the whole community have such an interest in it, that a mistake here assumes almost the grave nature of a fault.

Every tree has an expression as individual as that of a human form or countenance. "The manly oak, the pensive yew," the mournful cypress, the graceful willow, the delicate birch, the laughing poplar, are terms which arise from the universal law of association, and in grouping trees, reference should be had to the character and effect of each. We have but to recollect the involuntary admiration which certain happy combinations have produced in our minds, to be aware how much depends on this adaptation.

In certain situations, nothing can be more admirable than perfect uniformity. Witness the continuous rows of elms in Temple, and other streets in New Haven, Connecticut. Their stately forms, their regularly curving branches, producing long reaches of solemn, Gothic arches; the comparative lightness of the foliage which naturally rests in a spreading crown, sufficient for ornament and shade, but without obscurity or gloom; the great height at which the foliage is borne, like piles of green, feathery clouds far overhead, leaving an open space below, where the air circulates, and gleams of sunlight dance over the grass or the pavements—all circumstances unite to enhance the satisfaction which we feel when walking beneath these fine old trees. They are also peculiarly adapted to the quiet, reflective character of a place whose chief feature is an institution of learning, where the studious and thoughtful daily walk, and where the bustle and turmoil of business are almost unknown.

We have seen, also, long avenues of maples, leading to stately mansions, where a mixture of other trees would have disturbed the character, and marred the beauty. A grove of evergreens on the north side of a house, to screen it from the wind, or planted in the corner of an open field, to shade the flock in summer and protect it in winter, is always agreeable from the ideas of comfort and shelter which it suggests, while a cedar or a hemlock, standing alone and unpruned, upon a lawn, pleases the imagination by the contrast its wild and savage simplicity affords, to the high and exact cultivation around it.

But it is in the arrangement of groups and clumps of trees, in parks and lawns and pleasure grounds, that the hand of taste is most distinctly visible. I remember, on coming suddenly upon St. John's Park, in New York, being wonderfully struck with the artistic disposition of the trees; the sizes, forms, and shades of color, being so combined as to produce the most varied and beautiful effect. Here every tree had evidently been planted with reference to its immediate neighbors, and also to the general effect of the whole. Maple, willow, poplar, locust, horse-chestnut—almost every common variety of tree was there, yet so grouped as to acquire a new and startling beauty.

I walked, not long since, through Worcester Square, in New Haven. There was a profusion, too

SUMMER ROSE APPLE.

ONE of the most delicate and beautiful of all our summer apples is the Summer Rose. It is rather small, even below medium size, but this is no objection, in our opinion, to a dessert apple. There is no object in growing apples for the table as large as small pumpkins. The skin is smooth as marble, but of a rich, soft, waxy yellow, finely and delicately touched with a little red on the sunny side.

great a profusion, of pines, poplars, elms, maples and willows, but they appeared to have been planted on no other principle than that of an equal scattering of all the different kinds over the whole area. No sister willows drooped their arms carelessly over a by path; no family of thick standing pines gave an air of privacy and seclusion, inviting confidential friends, or solitary, thoughtful souls to seek their dim recesses; no sturdy maple or oak had a fair field left to him, in which to stretch his arms and build his broad and massive tower; but every individual tree seemed elbowing its neighbor, and all were growing together in a tame, promiscuous, expressionless manner, without exciting the admiration, or affording the pleasure which a different grouping would have enabled them to do. To be sure, the trees were half grown, and time may do something for them, more especially as many were dying out, thereby affording more scope for the others.

A tree which would be extremely interesting in one situation, would lose half its charm in another. A walnut scattered here and there, over a plowed field or a stony pasture, its slender shadow, and its promise of autumn treasure to the boys and girls of the neighborhood, is much more in place than in the centre of a lawn; while in the same field a drooping willow would appear entirely misplaced. There is so much sentiment and expression in this latter tree, that it should always be placed near the habitations of men, or in places much frequented by them. It is peculiarly appropriate to a gate-way; lovely when drooping over an arbor; inviting, when mingling with button-woods, it shades the low, green bank of a river; touching when it hangs its pendulous boughs over the little mound in the graveyard, and graceful and suggestive everywhere.

Here I would remark, that it is a little singular that the Lombardy poplar, once such a favorite, should have gone so entirely out of sight. In certain circumstances it has a very fine effect, especially by way of contrast and variety among trees of a light and airy character; or, where an effect of art and refinement is wished for in a wild, uncultivated spot. If the cultivation of this tree were sparingly revived, and that of the alanthus, with its awkward branches and disgusting and unhealthy odor, discontinued, it would be an improvement to the country. The absence of the alanthus might also be supplied by the sumach, which is similar in the character of its foliage, and has the advantage of being resplendent in the autumn, and which, if cultivated, rises to the dignity of a tree—rather a low one, to be sure, but not on that account the less desirable in certain situations. A clump of rocks, if you are so fortunate as to have one in sight, with here and there a small fir, or pine, or hemlock, inserted in its crevices, and a group of sumachs, or two or three butternuts, planted at its foot, (an operation which might be accomplished in a single day,) instead of being the deformity which it is very often considered, would, in a short time, become an object most pleasing to the eye.

It is surprising how generally the fact is ignored in many parts of the country, of the value of beauty on a farm, or about a farm-house or cottage, whether it is viewed as giving comfort, respectability and refinement to the family, or as enhancing the value of property by tempting the eye of wealth and taste, and securing a liberal purchaser if a purchaser is wanted. There is no doubt that attention to external beauty yields a large profit either in a mental or a pecuniary point of view. And in no one thing can this beauty be secured so readily as in the cultivation of trees. Plant them, and guard them until they have acquired a little strength, and nature, with her dews and winds, her sunshine and showers, does the rest. They make the mother proud of her home—the young people exult in their beauty and their shade—they screen the children in their plays, the superannuated in their repose—the traveler blesses them as he passes on his journey—the summer breezes murmur sweetly in their branches, the birds sing there; and in minds of any thoughtfulness or sensibility, they awaken admiration and gratitude towards the Being who gave them to the earth, as a joy and a blessing to man. S. S. A.

SQUASH.—In answer to E. D. J. in regard to the *Love Dutch Squash*, I would say that I am not acquainted with any variety by that name, but we have two kinds here that answer his description. One is a medium sized squash, good baker for table use; the other is a very large size.—G. D. J., *Yondalin, Cass Co, Mich., Dec., 1858.*

The flesh is tender, and abounds with a sprightly and refreshing juice. Ripens here in August.—The tree grows rather slowly when young, but is a good bearer. It is just the apple for the amateur's garden, and those who grow dwarf apple trees in their gardens should mark the *Summer Rose* as number one. Farmers, near large cities, who grow apples for market, would find this a paying variety.

NATIVE GRAPES.

Now that our native grapes, and particularly the new varieties, are receiving such general attention, and some inferior sorts are loudly applauded by those who have not had much experience, or are interested in over-praising them, the following, the result of the present season's observation on the grounds of the "Onondaga Community," will be interesting. It must be remembered that the season is not as favorable for ripening the Isabella in Onondaga County, as in most places in Western New York. Here, with proper pruning, the Isabella will ripen in nine cases out of ten.

NORTHERN MUSCADINE.—This is a seedling introduced by the Shakers of New Lebanon, and partakes strongly in habit and flavor of its parent, the New England "Fox grape." Fruited the first time this season by us. The clusters were small, and by no means as numerous as upon other sorts of the same age and similarly situated. It may improve by different pruning from what we have given it. The berries shell badly from the cluster, which will detract from its market value. Ripened and gone before the 15th of Sept., and, unless superseded by the *Delaware*, will be valued for its early maturity.

CONCORD.—This grape we consider a decidedly valuable acquisition. Fair and handsome clusters—perfectly sound and healthy. It is quite as early and hardy as the *Clinton*; has not quite so good a flavor as the *Isabella*, yet none, we think, could hesitate in saying that it is good enough. First ripe grapes were picked Sept. 17th. It has not been so uniformly productive with us as the *Isabella*; still it is generally considered very productive; and some vines of ours give signs of great fruitfulness; one small vine having only about two feet of bearing wood, bore fourteen clusters of fine grapes. We have planted this for a leading variety.

CHARTER OAK.—This is a "humbug" grape, disseminated to a great extent, we judge, by persons who had little just appreciation of good fruit or desire to introduce valuable grapes. A worthless grape in our esteem, and, says a nurseryman, "not worth the strings which hold it upon the trellis." Clusters small, none exceeding fifteen berries, yet some berries were four inches in circumference. One vine, large enough to have borne twenty or thirty pounds, hardly yielded as many ounces. There are so many inferior grapes cultivated in the country, when better may be had, that we are glad to help "write down" one of them.

CLINTON.—This is a very hardy and productive grape with us. It partakes more of the nature of the frost grape than of the fox grape. When allowed to fully ripen, its acerbity of flavor is much diminished, and is greatly liked by many who do not object to acid fruits. Bears handling well, and makes a violet-colored wine, which, however, needs some sugar in the manufacture.

DIANA.—This beautiful grape we fruited this season for the first time. It gives signs of being prolific. In all epicurean qualities it is superior to the *Isabella*. Ripe Sept. 25th, fully two weeks earlier than the *Isabella*, growing under the same conditions. Its fruit appears to be slightly disposed to shrivel and drop.

ISABELLA.—This old and well-known grape has fully sustained its character with us. Many clusters weighing half a pound each, and some one pound each. Though this grape would have fully ripened with us, yet we were induced to gather most of the crop before fully ripe from fear of a freeze. The worst that can be said of it is that we are not sure of ripening it here—more or less uncertainty always attends its ripening.

Our experience has confirmed us in a few practical conclusions, among which are:

- 1st. Shelter from west and north winds hastens maturity.
- 2d. Summer pruning or pinching favors the early maturity of the fruit and wood, thus better enabling the latter to bear the cold of winter. Clusters most exposed to the sun, other things equal, are soonest ripe.
- 3d. Deep culture is most favorable to a vigorous growth.
- 4th. Mineral manures produce a slower and sounder growth, thus rendering the wood more hardy, and less pinching or summer pruning necessary.
- 5th. The raising of grapes is one of the quickest ways which every man who owns a rood of ground, can take to supply him and his with a "royal fruit."

PLANTING TREES IN CLAY SOILS.

MISSUS EDS.—In a late number of the *RURAL*, it was recommended in setting trees, to dig deep, and mellow and enrich the soil below where the tree was to stand. This advice will ensure a failure if followed on a stiff clay soil. The reason why, I do not certainly know, but suppose it is because the soil makes the place a water-tank, and upon that the more sand and the more vegetable mould, the more deadly to the life and health of the tree.—For ten years I have practiced setting a few shade and fruit trees, and I can't say, with most correspondents, with success, but with uniform failure. I have dug deep and large, filled with sand and chips—dug trees when the ground was frozen four inches deep, so as to remove roots and dirt for three feet around the tree—set large trees, and small, and all to see them die after a sickly growth of two or three years. But do not understand me that I never made any trees grow; for sometimes I have dug more than I had places prepared—crooked, unpromising trees, which were set in the natural soil in some corner, and the ground hastily prepared, and these were the trees that grew. And the inevitable conclusion is that, true kindness to men, animals and trees, is natural and unaffected, and the best rules for all to follow, whose object is to improve upon nature, whether Doctors, Moralists, or Rurallists, to heed the practice of the sacred gardener, to "dig about it and dung it," and never dig under it and dung it.

But vice versa: in conversation with a successful farmer, who said before he emigrated from the land of Canada thistles, he and his hired man went out to mow down the thistles, to prevent their seeding, and in the midst of their work there came up a thunder shower. All the thistles mowed before the shower, died root and branch, the others did not. His conclusion was that the water filled the cavities of the stub before the sap could close it, and rotted the root. Try it, all who are furnished with the vegetable. T. W. Windham, Portage Co., Ohio, 1858.

REMARKS.—The trouble with our friend's planting is that he does not thoroughly prepare the whole ground by draining and subsoiling, as we recommended an inquirer in Canada to do, in the last number. Digging a large hole in a stiff, impervious clay, and filling it with a light loam, makes, of course, a good "sink-hole" for the water, which cannot pass through the clay soil. Dig a hole in clay ground, as deep as you should dig for a tree, say two feet deep, and if the water lies in it long after showers, spring and fall, or any time when the ground is wet; and rest assured the same thing will occur if you plant a tree in it, and fill it with loam—a fruit tree cannot be expected to flourish in such a place. Neither should we expect any better success to plant a tree in the same soil, and cover the roots with the clay for if it was kept light, as the ground in which a tree is planted should be, the effect would be about the same as if filled with loam, and if hard and impervious as the surrounding soil, what fruit tree could grow and prosper under such circumstances? The only true way is to thoroughly drain, and deeply pulverize a stiff soil, and then it will not matter how large the hole is made, or how much loam or sand is placed around the tree, so far as the water is concerned.

The scripture quotation is quite out of place. The direction to "dig about and dung it," was not made in reference to planting a tree, but to do something towards saving and making fruitful one that we presume had been badly planted, or placed in a poor soil.

A RUSSIAN HOT-HOUSE.—BAYARD TAYLOR describes the magnificent greenhouses, which the Czar maintains, for the production and growth of tropical and other exotic plants, amidst the snows of Russia:

"The Botanical Garden, in which I spent an afternoon, contains one of the finest collections of tropical plants in Europe. Here, in latitude 60°, you may walk through an avenue of palm trees sixty feet high, under tree ferns and bananas, by ponds of lotus and Indian lilies, and banks of splendid orchids, breathing an air heavy with the richest and warmest odors. The extent of these giant hot-houses cannot be less than a mile and a half. The short summer and long, dark winter of the north, requires a peculiar course of treatment for these children of the sun. During the three warm months they are forced as much as possible, so that the growth of six months is obtained in that time, and the productive qualities of the plant are kept up to their normal standard. After this result is obtained, it thrives as steadily as in a more favored climate. The palms, in particular, are noble specimens. One of them (*aphanix*, I believe,) is now in blossom, which is an unheard of event in such a latitude."

TRANSPLANTING EVERGREENS.—Will you, or some of the numerous readers of the *RURAL* inform me the best time to transplant Evergreen trees, such as Pine, Spruce, &c.—L. S. COOLIDGE, Hopkinton, St. Lawrence Co., N. Y., 1858.

REMARKS.—Large evergreens may be transplanted in the winter, when the ground is frozen, with a ball of earth attached to the roots. This is a safe, though troublesome operation, but pays well where a few fine specimens are needed for particular locations. For general planting we like the latter part of May.

PEAR TREES.—DWARF OR STANDARD.—In your issue of Nov. 20th, in an article which you copy from the *Horticulturalist*, on "Pear Culture," from the pen of Prof. CORPUS, occurs the following:—"I have a row of Bartlett's, the seed I took from the Louisa Bonne, and sowed for the stocks, in the autumn of 1854. In 1855 I bedded them. To-day these trees have from 30 to 45 sound, good sized pears," &c. Do these trees retain their dwarf nature, from the fact of the seeds from which the stocks were produced, coming from pear stocks dwarfed on the Quince? or, would trees produced in this way be called "Standards"?—A BOSSCAIBER, Niagara Co., N. Y., 1858.

REMARKS.—The seed is not affected by the root upon which the fruit is grown. The trees spoken of, therefore, are standards, as much so as if grown from seeds from a standard tree. The *Bartlett* bears when quite young, on its own roots.

COAL ASHES FOR THE BORER.—Though a novice, I have learned from a practical farmer, in Lee Co., that coal ashes, laid around the tree, close to it, will secure it against the apple borer.—W. BARNES, Keokuk, Iowa.

PRESERVING GRAPES.

You say in last week's *RURAL*, in reply to a query of the "Montgomery Ledger," that "there is no difficulty in keeping grapes here until after New Year's." I would add, that there is no difficulty in keeping them until spring. I kept them last year until the 15th of June, and they were then nearly as fresh and fine flavored as when first gathered. For four years I have not failed to have them, in good eating order, as late as the 15th of May. I use common black wadding, instead of newspapers, to put between the layers—one thickness only between each layer—and raisin boxes to pack them in, but any other clean, shallow box will do as well. They should be taken up at least once during the winter, and all the decayed and defective ones removed.

You remark that "they mature after picking if well kept," which accords with my own experience. The *Catawba* will become sweet and luscious, if gathered soon after they begin to color and whilst quite acid, and will keep better than when allowed to get fully ripe before gathering, but the flavor will not be as perfect.

Grape culture is just in its infancy in this country. The time will come when every farmer—every family I might say—will lay by a supply of grapes for winter use, as regularly as they now do a stock of apples or potatoes, and (I hope) when all the wine used, will be of home manufacture.—How I wish that I could add that nothing stronger would be drunk, and that, only at home, but I fear we shall never see that happy day. B. N. W. Alabama, Geneva Co., N. Y.

Domestic Economy.

HOW TO IMPROVE CIDER.

PROF. HORSFORD, the chemist, has recently communicated to the Massachusetts Horticultural Society, a valuable recipe for the improvement and preservation of cider, which the Springfield *Republican* recommends to general trial. It is as follows:

"Let the new cider from sour apples, (sound and selected fruit is to be preferred,) ferment from one to three weeks, as the weather is warm or cool. When it has attained to lively fermentation, add to each gallon, according to its acidity, from half a pound to two pounds of white crushed sugar, and let the whole ferment until it possesses precisely the taste which it is desired should be permanent. In this condition, pour out a quart of the cider, and add for each gallon one quarter of an ounce of sulphate of lime, (known as an article of manufacture under the name of 'anti-chloride of lime.') Stir the powder and cider until intimately mixed, and return the emulsion to the fermenting liquid. Agitate briskly and thoroughly for a few moments, and then let the cider settle. The fermentation will cease at once. When, after a few days, the cider has become clear, draw off and bottle carefully, or remove the sediment and return to the original vessel. If loosely corked, or kept in a barrel on draft, it will retain its taste as a still cider. If preserved in bottles, carefully corked, which is better, it will become a sparkling cider, and may be kept indefinitely long."

In connection with the foregoing we may state that we have been experimenting with cider in the following manner:—after the cider has been long enough in the barrel to settle, it is drawn off into jugs of two gallons and upwards in which it remains for a few days, when it is bottled, the corks being driven in tightly with a mallet. The filled bottles are laid upon their sides in straw, sawdust or bran, and permitted to remain until evidence of fermentation is exhibited by the forcing out of one or more of the corks, when all should be placed erect for a week or two when they may again be placed in a recumbent position. We have not as yet tied or wired any of the corks, but think it would be well to do so. Cider thus put up in October has retained its full sweetness, and in other qualities is much improved, while the same in barrels, has acquired considerable acidity. This mode is simply intended to preserve it from becoming "hard" or sour, and will not, of course, compare with what is known as "champagne cider." The following method is more intricate, but will give a superior article:

TO MAKE CHAMPAIGNE CIDER.—Have a perfectly clean barrel ready, with three or four strips of cotton cloth an inch or so wide and two feet long, prepared by dipping in melted brimstone. Light one and insert the lighted end in the barrel, through the bung. As soon as one piece is consumed light another, until the barrel is filled with a sulphurous smoke. While one person is doing this, another should prepare the cider, by straining it through a sieve overlaid with muslin cloth. It should be put into the barrel as quick as possible and bunged up. One gallon of pure whiskey to the barrel will entirely prevent fermentation, and a little dissolved isinglass will make it clear as wine. In this way it isinglass will be about the color of champagne, and keeps well as laid down many a year. Without the whiskey the fermentation will not be entirely arrested, though it will keep a good long time. Filtering through charcoal is a good plan where the right kind of charcoal, or bone black, can be obtained.

HOW TO MAKE BREAD.—Mrs. Washington Bacon, of Detroit, took the first premium at the Michigan State Fair, for making bread, and this is her recipe: Salt or milk rising, to one teacup of flour, add one teaspoon of salt, pour in two teacups of boiling water, when cooled so as not to scald, stir in flour to make a batter, and set it in a kettle of warm water until it rises up light, which will be in about five hours, pour the batter into your pan of flour and mix with warm water or milk in sufficiency to make four loaves of bread. Add a teaspoonful of soda to the wetting, knead thoroughly, and put it in the pans to rise, which it will do in half an hour. Bake one hour.

TO COLOR TANN.—If MOLLIE A. F., of Clyde, N. Y., has not yet dyed her De Laine, I will assure her that she can obtain a very beautiful color, with little cost. Make a strong dye by steeping hemlock bark in water. The quantity of bark used will determine the shade. After the goods have remained an hour in the hot liquid, rinse in lime-water, to brighten them. The lime-water is made by dissolving a quart of quicklime in a gallon of water, then allowing it to settle. Water sufficient for rinsing may then be added. Stir it often while coloring.—H. L. N., Sherburne, N. Y., 1858.

INQUIRY.—Can any of the *RURAL* contributors instruct me in the best method of making bread from the flour of green wheat.—H. L. N., Sherburne, N. Y., 1858.

Ladies' Port-Folio.

WHAT DOES THE BABY THINK?

BY J. G. HOLLAND.

Revs, kneeling and rocking the cradle.

What is the little one thinking about?
Very wonderful things, no doubt,
Unwritten history!
Unfathomed mystery!
Yet he laughs and cries, and eats and drinks,
And chuckles and crows, and nods and winks,
As if his head were as full of finks,
And curious riddles as any sphinx!
Warped by colic, and wet by tears,
Punctured by pain, and tortured by fears
Our lit is now and will lose two years;
And he'll never know
Where the summers go—
He need not laugh for he'll find it so!

Who can tell what a baby thinks?
Who can follow the gossamer links
By which the mannikin feels his way
Out from the shore of the great unknown
Billed, and winged, and alone,
Into the light of day?
Out from the shore of the unknown sea,
Tossing in playful agony,
Of the unknown sea that reels and rolls,
Spectered with the bark of little souls—
Barks that were launched on the other side,
And slipped from heaven on an ebbing tide!
What does he think of his mother's eyes?
What does he think of his mother's hair?
What of the cradle roof that flies
Forward and backward through the air?
What does he think of his mother's breast—
Rare and beautiful, smooth and white,
Beating it ever with fresh delight—
Cap of his life and couch of his rest!
What does he think when her quick embrace
Presses his hand and buries his face,
Deep where the heart-throbs sink and swell
With a tenderness she can never tell,
Though she murmurs the words
Of all the birds—
Words she has learned to murmur well?
Now he thinks he'll go to sleep!
I can see the shadow creep
Over his eyes, in soft eclipse,
Over his brow and over his lips,
Out to his little finger tips!
Softly sliding, down he goes!
Down he goes! Down he goes!
Rising and carefully retreating to her seat.
See! He is hushed in sweet repose!

HOOPOLGY, ONCE MORE.

E. C. H. has been anxiously looking to see if AMELIA values the wisdom of this world (which is foolishness, 1 Cor., 3, 19), as highly as E. C. H. does, and concluding from her writing on Hoopology, that she does not, sets her down as a mere scribbler, also classing all who have reached the position of petty editors, or writers for newspapers, if they say anything against what they consider the foolish fashions of the day—as no better than the rowdies standing upon the street corners. No doubt, (judging from the character manifested through the writing of E. C. H. on Hoopology) she belongs to a class similar to those spoken of in Mat. 23, chap. 23, verses 6, 7, and 8, which read thus:—"But all their works they do to be seen of men; they make broad their phylacteries, and enlarge the borders of their garments, and love the uppermost rooms at feasts, and the chief seats in the synagogues, and greetings in the markets, and to be called of men Rabbi, Rabbi." If such characters as described above, called the Master, Beelzebub, how much more likely latter-day characters of the same class will be to call those who would rather be of the household of faith, than of the household of latter-day fashions of this world scribbles and street rowdies. But we would have sister E. C. H. distinctly understand that we do not laugh at the imperfections of our fellow beings, but we "have compassion on the ignorant," and such as are out of the way, knowing that we are all compassed about with infirmities. We also believe he will not lay upon us more than we can bear, if we trust in Him who first loved us. "He that is wise is wise for himself."

But we should like to know, for the sake of knowledge, where the thousand "treasures" on health are to be found, that speak of heavy skirts as being the cause of nine tenths of the weakness and disease of females? We have read a number of authors on physiology and the laws of health, and have failed to discover one who attributes nine tenths of the weakness and disease of women to heavy skirts. And, being somewhat conversant with the living organisms of human beings, in different conditions of life, both in city and in country, we think a deficiency in the Coronal region, with a lack in the upper part of the Cerebrum—and being vastly more ignorant of the laws of life on which health depends than they are of the laws and follies of mankind—is the only reasonable and real cause of all the ailments poor human nature is subject to.

But we are ready to admit that the woman that loads herself down with skirts and quilts to make herself appear larger than a comfortable dress would, is precisely as foolish as the one who puts on hoops and crinolines for the same purpose. If all women throw the acquaintance of sister E. C. H. should throw aside hoops, and adopt some other foolish fashion, would she not soon adopt it, though it should be a thousand times more ridiculous than Hoopology?

Wisdom is the savior of the world, and E. C. H. seems to be wiser in her own eyes than seven men that can render a reason. We like to see women dressed in the fashion Paul spoke of in 1st Tim., 2, 9—"In like manner also that women adorn themselves in modest apparel." And Paul speaks to the point in 1st Peter, 2, 3—"While they behold your chaste conversation coupled with fear, whose adorning, let it not be that outward adorning of plaiting of the hair, and of wearing of gold, or of putting on of apparel." And to verse 4th he tells what is good—"But let it be the hidden man of the heart, in that which is not corruptible; even the ornament of a meek and quiet spirit, which in the sight of God is of great price."

But Paul and Peter saying a thing is so, does not prove it. Truth was truth before their per-

sonal existence commenced on earth, and all they could do was to discover it. But the great mass of American women we think (judging from their actions) believe there is no wisdom to be found anywhere except in following a certain bag, called Custom—who is more tyrannical than Pharaoh himself,—and the foundation on which she stands is Mr. and Mrs. Ignorance, the same weakness and imbecility on which all Tyrants depend for their power over the children of men. So those who follow the unnecessary fashions of the Nineteenth Century show by their dress, plaiting of their hair, and the gold they wear, that they think more of making an appearance externally, than they do of cultivating their immortal minds with an eye single to the glory of God, and the everlasting good and happiness of mankind.

"Courage, Sister! do not stumble,
Though thy path is dark as night;
There's a star to guide the humble—
Trust in God and do the right."

"Let the road be long and dreary,
And its ending out of sight;
Walk it bravely—strong or weary—
Trust in God and do the right."

"Perish 'policy' and cunning,
Perish all that fears the light;
Whether losing, whether winning—
Trust in God and do the right."

"Trust no party, church, or faction,
Trust no 'leaders' in the fight;
But in every word and action,
Trust in God and do the right."

"Trust no form of guilty passion—
Fiends can look like angels bright;
Trust no custom, school, or fashion—
Trust in God and do the right."

"Some will hate thee, some will love thee,
Some will flatter, some will slight;
Cease from man, and look above thee,
Trust in God and do the right."

"Simple rule and safest guiding,
Inward peace and inward light;
Star upon our path abide—
Trust in God and do the right."

Byron, N. Y., 1858. TRUTH SEEKER

DUTIES AND PLEASURES OF WOMEN.

GREAT indeed is the task assigned to women. Who can exaggerate its importance? Not to make laws, not to govern empires, but to form those by whom laws are made, armies led, and empires are governed; to guard from the slightest taint of possible infamy, the frail and yet spotless creature, whose moral, no less than physical being, must be derived from her; to inspire those principles, to inculcate those doctrines, to animate those sentiments which generations yet unborn, and nations yet uncivilized, shall learn to bless; to soften firmness into mercy, to chasten honor into virtue; by her soothing cares to allay the anguish of the mind; by her tenderness to disarm passion; by her purity to triumph over sensuality; to cheer the scholar laboring under his toil; to console the statesman for the ingratitude of a mistaken people; to compensate for hopes that are blighted, for the friends that are perfidious, for happiness that has passed away. Such is her vocation—the couch of the tortured sufferer, the cross of the neglected child—these are the scenes of woman's excellence; these are the theatres on which her greatest triumphs have been achieved. Such is her destiny—to visit the forsaken; amid the forgetfulness of myriads, to remember; amid the execrations of multitudes, to bless; when monarchs abandon, when brethren and disciples fly, to remain unshaken and unchanged, and to exhibit in this lower world a type of that love—pure, constant, and ineffable—which in another world, as we are taught to believe, is the best reward of virtue.

ORDER IN THE ECONOMY OF THE HOUSEHOLD.—A woman should never allow hurry or bustle to be the practice of the household, or nothing will be well done. It is hardly consistent with due house-keeping competency for any woman to say that she has not time to perform some important duty, but which is essential to family thrift and comfort; a proper arrangement and economy of time leaves opportunity for all things needful. Economy is an arrangement or order of things designed to produce a certain result; therefore, no economy can be so important as the economy of time. A minute's reflection in the morning will enable the lady of the household to make due arrangements for the employment of the day before her, so that no time shall be mispent—the important duties to be performed at regular and stated periods, the lesser occupation to be introduced to fill up the disengaged moments. In the day's pursuits of a family there may be, however, unavoidable interruptions—visitors, unforeseen domestic affairs, or accidents; but for these, a well regulated mind is always prepared. Idle visitors most and will infect the houses of the industrious, at unreasonable hours; but the time need not be wholly lost; a piece of knitting, needle-work, drawing, or even some simple household occupation may be carried on without offense to the visitors, and may, on the contrary, afford them a useful lesson.

MOTHER.—O, word of undying beauty; thine echoes sound along the walls of time till they crumble at the breath of the Eternal. In all the world there is not a habitable spot where the music of that holiest word has not sounded. By the golden flow of the river, by the crystal margin of the rock, under the leafy shade of the forest tree, in the hut built of the bamboo cane, in the mud-daubed cottage, by the grand peaks of the sky kissing mountains, the wide spread valley, on the blue ocean, in the changeless desert where the angel came down to give the parched lips the sweet waters of the wilderness, on the altar where the father stayed the downward stroke of his sacrificial knife, warmed by the voice of God, between the billows, that like solid walls of ruby threw their crimson on the swarthy brows of Israelitish men, and lighted the dark eyes of the women, under the white tent of the Arab, and in the bark-covered wigwam of the Indian hunter—wherever the pulse of a human heart beat quick and warm, or float feebly along the current of falling life, there is that sweet word spoken, like a universal prayer—"Mother."

It is a sign of extraordinary merit, when those who most envy it are forced to praise it.

Choice Miscellany.

Written for Moore's Rural New-Yorker.
VERSES.

BY M. P. HATHAWAY.

We've laid thee to sleep in thine own quiet glen
Where thy requiem's sung by the sorrowing wren,
Where the song of the dove for its mate is heard mourning,
And the robin chirps sad for its love ne'er returning.

We've laid thee to sleep in thine own quiet glen,
Where the gurgling brook makes its music to blend
With the songs that are sung in the grave o'er its head,
Wooling rest for thy clay, though the spirit is fled.

We've laid thee to sleep in thine own quiet glen,
Far away from all scenes 't would disturb thee again,
Where the angels will guard thee, and purity weep
That so cold in the ground must her votary sleep.
Perry, N. Y., 1858.

UNBURNISHED JEWELS.

An idler wandered along the sea-shore. Many and beautiful were the shells and pebbles he had gathered, but among them all there was one stone of seeming roughness, and almost devoid of beauty. Looking upon it with contempt as he contrasted it with the delicate sea shell, and moss-crested pebble, he threw it back upon the sand, where it lay many years, until another passed that way, and seeing the stone, noted with careful eye its structure, and bore it away as a rich treasure. The skill of the burnisher was employed, and lo, instead of the rough stone, there appeared a jewel of such wondrous brilliancy that it might well grace a monarch's diadem.

As in the physical world, so also in the intellectual world, there are unburnished jewels. Men have lived and died, unknown, uncared for by the world, who were possessed of noble minds and mighty capacities, while others, with no better natural faculties, have risen to places of eminence, and have left their names in glowing characters upon the book of Fame. And why this difference? The one was chained down by the force of circumstances, while the other, by that same power, seemed to be drawn upward in the scale of being. Much genius slumbers for need of awakening. Let one of these minds be but polished by education, the dross of ignorance removed, and it would become even more brilliant than the polished jewel. Life is be-gemmed with jewels—unburnished jewels, and we are endowed with the power of polishing them ever so brightly if we will. We are, in a measure, our own fate makers. Sources of happiness are placed within our reach, and we may draw from these sources and appropriate to our own use whenever we will. Jewels of happiness there are, but too often we leave them behind us. Nature, teeming with beauty, opens far before us that all may enjoy her loveliness. She awakes us each morning with the song of her birds, and lulls us to sleep at night with the wind music—"the whispering of the gales." All this was intended to afford delight, but too often the heart of man is insensible to it, and thus one of the brightest jewels in the crown of his rejoicing is left unpolished.

There are many jewels in the soul or every individual there are planted gems of goodness, and despite the blight which vice has cast there, noble feelings will come swelling up—holly, heaven born aspirations. We should carefully seek out these gems of goodness in our own hearts, and in the hearts of those with whom we are associated, and over whom we exert an influence, and polish them until they shall shine unclouded by the blight of sin.

Friendship is a fair gem in the human heart, and lonely, aye, but a wreck seems the soul when it is unburnished by sympathy and refinement. A jewel so valuable, let us carefully polish it until it shall not only fill our own hearts with light, but reflect its light back upon the hearts of those who surround us. Hope is a jewel of untold worth, but when its light is clouded by the darkness of despair, midnight blackness settles over the soul, crushing out the life of all its joys.

As the idler upon the sea-shore, so do we, upon the shores of time, grasp with childish eagerness those pleasures that glisten like the bright shell, while we leave joys of a more substantial nature unnoticed, because, perchance, they do not shine. We seek with restless heart for something we may cherish—something that will afford us delight, and we forget in our search that a kind Father has strewed our pathway with jewels of happiness.

Jewels are around the earth-weary pilgrim gather them—burnish them—wear them next thy heart. They shall light thy pathway, even to the pearly gates—more, they shall enter there, and, blending with the light of Heaven, shall shine eternally in glorious beauty. ANNA A. FOLLEY.
Hillsdale, Mich., Nov., 1858.

CONSTANT EMPLOYMENT.—The man who is obliged to be constantly employed to earn the necessities of life and support his family, knows not the unhappiness he prays for when he desires wealth and idleness. To be constantly busy is to be always happy. Persons who have suddenly acquired wealth, broken up their active pursuits, and begun to live at their ease, waste away, and die in a very short time. Thousands would have been blessings to the world, and added to the common stock of happiness, if they had been content to remain in an humble sphere, and earned every mouthful of food that nourished their bodies—Persons who are always busy, and go cheerfully to their daily tasks, are the least disturbed by the fluctuations of business, and at night sleep with perfect composure.

PROFANE LANGUAGE.—It is related by Dr. Soudier, that on his return from his mission in India, after a long absence, he was standing on the deck of a steamer, with his son, a youth, when he heard a gentleman using loud and profane language—"See, friend," said the doctor, accosting the sweeper, "this boy, my son, was born and brought up in a heathen country, and a land of pagan idolatry; but in all his life he never heard a man blaspheme his Maker until now." The man colored, blushed out an apology, and looked not a little ashamed of himself.

CHOICE MELANGE.

The world oftener rewards the appearance of merit than merit itself.

DASTARDLY men are sorry horses; they have just spirit and mettle enough left them to be mischievous.

He who tells a lie is not sensible how great a task he undertakes; for he must be forced to invent twenty more to maintain that one.

To relieve the oppressed is the most glorious act a man is capable of; it is in some measure doing the business of God and Providence.

BURNS once said,—"My idle reasonings sometimes makes me a little skeptical, but the necessities of my heart always give the cold philosophizing the lie."

We become familiar with the outside of men, as with the outside of houses, and think we know them, while we are ignorant of all that is passing within them.—BOYCE.

A GOOD work it is, no doubt, to pare off all unnecessary occasions of debate and differences in religion, provided we go not so near the quick, as to let out any of its vital spirits.—Owen.

We ought not to be over anxious to encourage innovation, in cases of doubtful improvement, for an old system must ever have two advantages over a new one; it is established, and it is understood.—LACON.

If a man would register all his opinion upon love, politics, religion, learning, &c., beginning from his youth, and so go on to old age, what a bundle of inconsistencies and contradictions would appear at last.

ALL politeness is owing to liberty. We polish one another, and rub off our corners and rough sides, by a sort of amiable collision. To restrain this is inevitable in bringing a rust upon men's understandings.

YOUTH beholds happiness gleaming in the prospect. Age looks back on the happiness of youth; and instead of hopes, seeks its enjoyment in the recollection of hopes. Thus happiness ever reigns in the imagination.—Coleridge.

If, as Franklin says, every able-bodied man and woman would labor only four hours a day, there would be superabundance for all. Nobody, of course, would then talk of the world "owing them a living"—they would take it.

AS ISAAC met his bride in the fields at eventide, so do true souls frequently find their joy and consolation in the loneliness of solitude, and at the sunset of their earthly pleasures. He who would see the stars sparkling with ten-fold lustre, must dwell in the cold regions of snow.

No man is more miserable than he that bath no adversity; that man is not tried whether he be good or bad; and God never crowns those virtues which are only faculties and dispositions; but every act of virtue is an ingredient into reward.—God so dresses us for heaven.—Jeremy Taylor.

READING is one of the greatest consolations of life; it is the nurse of virtue; the upholder in adversity; the prop of independence; the support of a just pride; the strengthener of elevated opinions; it is the shield against the tyranny of all petty passions; it is the repeller of the fool's scoff and the heaven's poison.

How easily one can tell whether a man is glad from within; or whether it is only the play of the sunbeams that chance to fall upon him. Happiness is not the work of a chisel and mallet; not mortised into the soul, it is "put out" like the arm of a tree, whose green, untraveled sleeve flutters with the life it shares.—Taylor.

AMERICAN CHILDREN.

AMERICAN children, we are sorry to be obliged to say it, are not, as a general rule, well-behaved. They are rude and disrespectful, if not disobedient. They inspire terror rather than love in the breast of strangers and all persons who seek quiet and love order. In our drawing-rooms, on board our steamers, in our railroad cars and stage coaches, they contrive to make themselves generally and particularly disagreeable by their familiarity, forwardness and pertness. "Young America," cannot brook restraint, has no conception of superiority, and reverences nothing. His ideas of equality admit neither limitation nor qualification. He is born with a full comprehension of his own individual rights, but is slow in learning his social duties. Through whose fault comes this state of things? American boys and girls have naturally as much good sense and good nature as those of any other nation, and, when well-trained, no children are more courteous and agreeable. In the days of our grandfathers, children were taught manners at school—a rather rude, backwood's sort of manners, it is true, but better than the no-manners-at-all of the present day. We must blame the parents rather than their children. If you would have your children beloved and respected by their elders as well as their contemporaries, teach them good manners in their childhood. The young sovereign should first learn to obey, that he may be the better fitted to command in his turn.—How to Behave.

THE DIVINE MERCY.—However old, plain, humble, desolate, afflicted we may be, so long as our hearts preserve the feeblest spark of life, they preserve also, shivering near that pale ember, a starved, ghostly longing for appreciation and affection. To this attenuated spectre, perhaps a crumb is not thrown once a year; but when abandoned and athirst to famine—when all humanity has forgotten the dying tenant of a decaying house—divine mercy remembers the mourner, and a shower of manna falls for lips that earthly nutriment is to pass no more. Biblical promises, heard first in health, but then unheeded, come whispering to the couch of sickness; it is felt that a pitying God watches what all mankind have forgotten; the tender compassion of Jesus is recalled and relied on; the fading eye, gazing beyond time, sees a home, a friend, a refuge in eternity.—Charlotte Bronte.

LOOKING DOWN.

You may borrow to-day and also to-morrow,
Going on step by step from borrow to borrow,
But one thing is certain, you should not forget,
You never can borrow yourself out of debt.

Sabbath Musings.

THE SABBATH EVENING.

How calmly slinks the parting sun!
Yet twilight lingers still,
And, beautiful as dreams of heaven,
The slumbering on the bill.
Earth sleeps with all her glorious things,
Beneath the Holy Spirit's wings,
And rendering back the hues above,
Seems resting in a trance of love.

Mysterious music from the pines,
O'er yon dark rocks retired,
Falls like the whispered words of peace
Upon the heavenly mind;
And winds, with pinions steeped with dew,
Breathe gently, as if stealing through
From Eden's bowers, they came to bless
The spirit with their holiness.

And yonder glittering throng of clouds,
Retiring from the sky,
So calmly move, so sweetly glow,
They seem to fancy's eye
Bright creatures of a better sphere
Come down at noon to worship here,
And from that sacrifice of love
Returning to their homes above.

The blue isles of the golden sea,
The night arch, doating high,
The flowers that gaze upon the heavens,
The bright streams leaping by,
Are living with religion; deep
Its glories on the waters sleep,
And mingling with the moon's pale rays,
Like the soft light of parting days.

The spirit of the holy eve
Comes through the silent air,
To feeling's hidden spring, and wakes
The gush of music there;
And the far depths of ether beam
So passing fair, we almost dream
That we can raise and wander through
Their open paths of trackless hue.

Each soul is filled with glorious dreams,
Each pulse is beating wild,
And thought is soaring to its shrine
Of glory undefiled;
And holy aspirations start
Forth from the temple of the heart,
And chain—for earth's dark ties are riven—
Our spirits to the gate of heaven.

THE EARLY DEAD.

"No tears for thee, though light be from us gone
With thy sweet presence, bright, but restless one,—
No tears for thee:
They that have loved an exile, must not mourn
To see him parting from his native bourne,
O'er the dark sea."

We do not wonder when the aged die. Their day of toil, activity and care is past, and, like shocks of grain fully ripe, they have been tenderly gathered by the Angel Reaper, where there is rest for the worn and weary. The deep founts of the heart are stirred as memory, faithful to her trust, leads us through the shadowy path. We sadly miss their love, their counsels and their prayers. They have been to us watchful guardians; faithful friends. Their work on earth has been well done,—they have gone from labor to reward, and altho' we sorrow, we cannot but feel that it was meritorious in our Heavenly Father to call them home. It is not thus when the young—those in life's fair morning—are called to go down to the silent tomb—For them we had planned a life of active usefulness, of high endeavor—a life that would dry many a falling tear, shed light and joy upon many a darkened pathway of this sin-shadowed earth.—They were so full of life, and enjoyed so intensely the melody of a world all new and beautiful. Just ready to enter upon the duties of their untired existence, with hearts full of generous emotions, and eyes beaming with joy and affection, the cold hand has touched them, and they are sleeping, pillowed on the lap of Mother Earth. The broken shaft is reared to their memory, feebly shadowing forth what seems to us their imperfect existence. Alas, how dim is fate's vision! Are they not breathing the pure air of a higher life, where that which was so beautiful, so full of promise on earth, will forever expand beneath the genial influences of the better land? Although death has hushed the music of their voices on earth, with their fingers on the golden wires of a celestial harp, they have gilded into the unseen, and joined those heavenly anthems that are only sung in the Home of the Happy. Hearts that loved them well may be bleeding in the dust, yet even amidst our tears we can but rejoice that they have gained a more radiant with the Light of Infinite Love—never dimmed by any passing shadow. Would we wish them back, to grope with us in darkness, vainly longing for the light? God forbid. Let us rather struggle on bravely and hopefully, gladdened, even in our sorrow, by the thought that soon may we meet them in those mansions prepared by the blessed SAVIOR, for all that love Him. HATTY.
Farmington, Mich., 1858.

I TELL you, a pastor's labors are no child's play. I have swung the axe and the grubbing hoe, have handled the plow, the cradle, and the scythe; I have had to work till this stiffened arm bears proof of its severity, but all this work was play, mere play, when compared with the labors of a pastor, to this brain-work which wears out the whole man.—Dr. Plummer.

CHRIST'S creating power drew the world out of nothing, but his converting frames the new creature out of a something worse than nothing. What power that must be which can stop the tide of the sea, that can change a black cloud into a glorious sun? It is not so great a work to raise many thousands killed in battle as to gospelize one dead soul.—Charnock.

So often as thou rememberest thy sinners without grief, so often thou repeatest those sinners for not grieving; he that will not mourn for the evil which he hath done, gives earnest for the evil which he means to do; nothing can assuage that fire which sin hath made, but only that water which repentance hath drawn.—Quarles.

To be angry, is to revenge the fault of others upon ourselves.

Sketches from the Alps to the Adriatic.

NUMBER TEN.

Venice—The Doge's Palace—Bridge of Sighs—The Winged Lion—Nick the Gambler—The Ducal—Scenes along the Wharf—Gondolas and Gondoliers—Walking in Venice—Streets, &c.

The Doge's Palace stands between the Cathedral and the Quay. The sides towards the Lagoon and Square, are composed of two rows of arches, one above the other, supporting a wall made of small blocks of red, white, and black marble. The rows of arches are of unequal height, and the number of arches in each row is also unequal. The capitals of the columns are all of white marble, though now blackened with age. They are elaborately carved—fruits, flowers, leaves, and animals, being represented to the life on them, but no two are alike. Notwithstanding this diversity of detail, which is pleasing, the general effect of the palace is imposing and harmonious. The most interesting part of the palace is the apartments associated with history. In the wall of the ante-room, where the Council of Ten held its sittings in the days of the Oligarchy, is a small slit which was formerly decorated with a lion's head, and formed the celebrated lion's mouth, into which secret denunciations were thrown. In the lower story of the palace are the dark cells in which prisoners of State were confined, with dark and narrow passages leading to them. There is one which remains in about the same condition as when used. The cell is lined with wood, and from the center of the floor rises a little platform on which the prisoner slept. By the side of the door which is, perhaps, four feet high, is a round hole. On the opposite side of the passage is a little niche in the wall, in which a lamp was placed for a short time each day, and the little light which entered through the round hole, was all that the prisoner received.

You may pass from this cell along a narrow and dimly lighted passage, and come to a door that is old and massive, plated with iron, and secured with a bar and lock. It creaks and creaks as the guide throws it back, and you wonder if it were so noisy and cross in the days of the cruel Republic. A few easy steps upward, in a higher and lighter passage, and you look out of a square window, having a strong stone grate before it. On either hand are stone walls; below is a still, dark canal which passes under a low bridge a few rods distant, and emerges into the Lagoon. You stand in Venice,

—“On the Bridge of Sighs,
A palace and a prison on each hand,”

and it seems as if the very air grew strange, when you think how many an unhappy wretch has passed from that palace where he heard his doom through that vaulted bridge into the prison where he was executed. And is it a wonder that the sighs which broke from him as he caught his last glimpse of the fair face of Nature through that grated stone, should haunt the spot, and give the bridge its significant name?

You will never forget your impressions as you stand on that low bridge in the night, and gaze up the dark canal between the palace and the prison that are connected by the Bridge of Sighs. All is dark, only two lamps far up the canal throw light on the water. You think how often in the days of unprincipled power a black gondola has received some doomed victim at those strong, low palace doors, and steps half covered by the salt water. A few silent strokes of the oar, and the gondola glided out upon the Lagoon. In a little while it returned again, but without the prisoner, for he had gone down in the deep sea, in a place where the laws of Venice made it death to cast a net. Morning broke, and the black gondola lay motionless, moored by the stone steps, and the passers by knew nothing of its midnight work. They only perceived, after a time, that one of their number, who had expressed sentiments that were obnoxious, perhaps, to the government, had disappeared. And if they surmised what scene had transpired, in the dark night, and the black gondola, out on the open Lagoon, they only shuddered and were silent.

There are some other objects in the vicinity of the Square that are remarkable. The Winged Lion of St. Mark, looks towards the Doge's Palace. He is not a noble looking lion, but rather fierce and treacherous, and you cannot help thinking him to be a true symbol of the old Republic. Not far off is another granite column surmounted by the figure of St. Theodore, who was patron Saint of Venice before St. Mark. He stands on a crocodile and holds a shield in his right hand and a spear in his left. Those two columns were brought from the Holy Land in the 13th century, and after being landed it was found impossible, at first, to raise them to their pedestals. At length, a reward having been offered, a Lombard called Nick the Gambler, succeeded in placing them in their positions. Nick then demanded that the law would allow games of chance, which it prohibited elsewhere, to be played between the columns. The Council made the concession, but also commanded all public exhibitions to be performed there, which soon brought the gambling spot into disrepute.

Before the Cathedral stand three tall masts, in pedestals of bronze. Formerly these gonzifons of silk and gold, emblematic of the three dominions of the State—Venice, Cyprus, and the Morea—waved from their peaks, but now the Austrian colors float there. Then there is the clock-tower, through which an arched passage leads, into the most commercial part of the city. The tower is surmounted by a bell, upon which two bronze giants strike the hours with ponderous hammers. There are always large flocks of doves about the Square, and they are fed once a day at the public expense. This custom has existed a long time, and is said to have originated in the days of the Republic, when some pigeons carried important news from a distant army to Venice. The Senate then decreed that they should thereafter be fed daily in the Square, at the public expense. The doves are very tame, and when the clocks strike two, the hour for feeding, they come wheeling in

from all directions, and light on the pavement right among the people.

The scene along the wharf is full of interest, for there is a touch of the East in it. There are sailors from the Orient, wearing red sashes and skull caps, from which hang tassels. There are jugglers, amusing a picturesque crowd with clumsy performances; musicians giving miniature operas, and men going about, selling fresh water, bad lemonade, and cognac. A whole fleet of gondolas is moored to the wharf, and many are darting rapidly about on the Lagoon and Grand Canal. Sailors and gondoliers loiter around, and lie down at the base of the column that bears the Winged Lion. If you approach too near, you are beset by a crowd of gondoliers, all anxious to be employed. The old-fashioned gondolas are twenty-five or thirty feet long, and taper sharply at both ends. The bow and stern rise upward, and many of them, when empty, rest but little more than half their length on the water. They are painted black, and the ends are decked over, and commonly ornamented with carving. In the middle is a black cabin, large enough for two persons to recline comfortably on the cushions within. The gondolier stands on the stern, and uses one long, broad-bladed oar, which rests in a curiously shaped oar-lock. He faces the bow, and pushes the oar from him, instead of pulling, and his position, when leaning forward, is very fine, and expressive of motion. Their skill is wonderful, often they pass each other so close, that you could not put your finger between the boats, yet they do not touch. And they glide round sharp corners into narrow canals, at full speed, and uttering their warning cries of “*Stia le!*” and “*Stia li!*” turn, as it were, on a pivot, the sharp iron on the bow just grazing the wall on one side, and the side of the boat almost pressing the corner on the other. In the threading the most intricate canals, or going among a crowd of gondolas and larger boats, all passing in different directions, you scarcely ever feel the jar of the slightest collision.

One can easily imagine that it is delightful employment to repose on the cushions, and, fanned by the sea breeze, glide about for hours, part of the time on the open Lagoon, through winding and intricate canals, under bridges decorated with humorous faces that stare down upon you as you pass, by churches and palaces rising from the water, with sea-weed clinging to their marble steps and foundation stones. Then there is such a remarkable silence—no hum of rolling carriages, and multitudes crowding along wide streets, only the frequent ringing of bells, the dreamy splashing of the oar, harmonizing well with the gentle rocking of the gondola, and the agreeable sense of forward motion.

Not less strange is it to walk, for you can walk all over Venice. You thread streets more crooked and intricate than the canals, often so narrow, that if you stand in the middle and extend both arms, you touch the walls of the buildings with either hand. You cross bridges, and go through dark passages, into which the sun never shines. You loiter and wonder, and turn to the right and the left, just as your fancy leads, charmed by the singularity of scenes which exist nowhere else in the world, until, finally, you are lost. It matters nothing, however, for you know that you can find a gondola in a few minutes, and you wander on with increased interest. You determine to find your way back alone, and turn your steps to where you think the Rialto springs, at one leap, across the Grand Canal. You lay your course by the compass, but shortly you come to a canal that intersects the narrow street. You take another street that leads in the direction you wish to go, and in five minutes you are in a courtyard, where the street comes to an end. Thus you wander on, turning this way and that, exploring dark and narrow passages and confined courtyards, retracing your way, wondering and admiring, until suddenly you find yourself on the Grand Canal—but a mile from the Rialto. Now you take a gondola rather than turn back into that labyrinth of crooked, narrow streets, passages, canals, and impassable courtyards.

G. F. W.

DEATH OF MADAME IDA PFEIFFER.

This celebrated traveler is dead. She was of Austrian parentage, born at Vienna in 1797. She was married to Dr. Pfeiffer in 1820, and a few years later became a widow. The intense desire for travel which she had felt since childhood had hitherto been repressed by circumstances, but now free to indulge it, she commenced a series of voyages which certainly no woman, and perhaps no man living has paralleled. Having by several years of economy amassed a sufficient sum, she set off for Jerusalem, and her travels through the Holy Land formed the material for her first book. Her next expedition was northward, through Denmark, Sweden, Norway and Iceland. She wrote another volume giving an account of this journey, and it was hardly issued from the press before she undertook another. This was no less than a tour round the world. She left Vienna in May, 1846, sailed to Rio Janeiro, traversed Brazil, went round Cape Horn, landed in Chili, set sail again for Otago, thence for China, and from there to India. She passed on to Arabia, went up the Tigris to visit Nineveh and Babylon, wandered through Khordistan and Persia, crossed the Caucasus, went through Southern Russia, visited Constantinople, traveled through Greece, and returned home.

That a woman alone and unprotected should make such extensive voyages, and face the perils of sea and land, and that, too, for pleasure only, excited great wonderment, when her account of it came to be published. But the public were to be still more astonished. Hitherto she had traveled where others had traveled before, and where civilized commerce had to some extent penetrated. Her next excursion was among cannibals and savages. In 1851 she sailed to the Cape of Good Hope, thence to Singapore, and thence took a tour to Sarawak in Borneo, and through the dangerous country of the Dyaks. Perhaps her very audacity in coming among them, as well as her coolness and good humor, caused her to be received with hospitality, instead of being devoured as other European visitors had been. She laughingly told them she was too old and tough to be good eating, and to their relief of the joke, she ascribed their forbearance to dine upon her. From thence she went to the Spice Islands, then visited Califor-

nia, and then home, having a second time completed the circuit of the world, in an opposite direction from her first journey. During all her travels she had experienced excellent health, until in Madagascar she contracted a violent fever, the effects of which never entirely left her, and at last resulted in her death.—*Albany Journal.*

FLOW OF WATERS.

Communication of Lake Superior with Lake Ontario by a Subterranean Passage.

Several short articles have been published on this supposed communication. They do not appear to have any substantial support. The facts do not authorize any such supposition or require any such wonderful solution.

Is such a subterranean passage possible? Let us see. We do not so much understand the interior structure of the earth to deny the possibility. A stream of water is known to sink into the earth, and appear again at some miles distance. The great Kentucky Cavern has a large subterranean stream, and of the origin and termination of it the world is ignorant. The distance from Lake Superior to Lake Ontario is great, the middle of the former being about nine degrees of longitude west of the middle of the latter, and the difference of latitude at least four and a half degrees; hence, the distance is not far from 500 miles directly. The level of Lake Ontario is given as 232 feet above the sea, and its depth 500 feet, and that of Superior 596 feet, and its depth 900 feet; so that the bottom of Lake Ontario is nearly on a level with the bottom of Lake Superior. So, Lake Huron is given as 578 feet above the level of the sea, and 1,000 feet deep.

Before we depend on these soundings of the lakes, let us know the proof of their correctness. Where is the record of these soundings? by whom made, and when, and by what authority? Then, let us see whether, if they are correct, they afford any proof of the subterranean communication between the Western and Eastern lakes.

Then, again, it is a well known fact that the Eastern lakes rise after the rise of the Western, when the waters have had time to pour out their superabundance into the Eastern. If the melting of the winter snows are attended or followed with uncommon falls of rain in the spring months, in due time the Eastern lakes are unusually high. Such have been the facts the season past. Lakes Erie and Ontario were high till into September. Sometimes, the heavy rains of the great western watershed fall in late summer or the fore part of autumn, and high water in the Eastern lakes follows two or three months later, so that the highest water of Lake Ontario is in winter. Thus, in 1843, Lake Ontario was highest in the beginning of January, in which month it is often the lowest. In 1853, the lake was about the mean height in January, and gradually rose each month to June, when it was pretty high, and then gradually fell to the end of the year, evidently depending on the relative quantity of rain and snow over this great watershed. For Lake Erie is affected by the rains sooner than Ontario; and thus, as you pass up the lakes to the west. The facts do not require any subterranean passage.

Besides, as the level of Lake Superior is given 364 feet above that of Lake Ontario, the pressure from this depth would be, on a square foot, 22,750 pounds, and would show in Lake Ontario such a spring, as could not fail of detection, if the subterranean passage was even one square foot.

Still further. Intelligent observers who have examined the Upper Lakes, and especially Lake Superior, have some of them doubted whether the rivers which discharge their waters into that lake are adequate, with the necessary amount of evaporation, to supply the stream which flows out of it and helps to fill Lake Huron. Already the suggestion has been made of the necessity of subterranean streams to keep Lake Superior full, instead of any hole in its bottom or nearer the surface t-

carry off its water to the lakes below. The proper measure of the influx of water by the rivers and streams, and of the efflux by the Sault St. Marie, will unquestionably show that there is water enough for the required supply, and no excess which would require a subterranean outlet into Lake Ontario.

Finally. Not a few important particulars must be ascertained to great minuteness before there can be any propriety in supposing such a communication through the earth between the giant lake on the West and the less on the East. Young America is not quite patient and active enough in the accumulation of facts, but indulges an imagination too fertile in hypotheses.

This is a day of speculations. Let it be the purpose of us all entirely to avoid those that are unnecessary or unprofitable. C. D.

Rochester, Dec., 1858.

LAYING THE TELEGRAPH CABLE.—Can you or your correspondents answer scientific questions like the following? In laying the Atlantic Cable, how could they make soundings while the vessel was under motion? And if the vessel was still, how could they sink the lead in such an amazing depth of water? for, it is said, on account of the density of the water, a body will sink only so far, and there remain at rest; and some think the cable does not lie on the bottom in the deepest water.—T. P. H., Farmington, Mich., Nov., 1858.

REMARKS.—In taking soundings, the usual way is to throw the lead at the bow, and draw it up at the stern of the vessel, when in motion. In shallow water this answers very well, but in deep sea soundings, or where it is necessary to make the measurement as accurate as possible, the vessel must “lay to,” while taking soundings. It has been thought by some that heavy bodies would only sink a certain distance, and there remain suspended, on account of the density of the water, but of this, we believe there is no proof. Indeed, in the deepest part of the “telegraph plateau” small sea shells were brought up by the lead, which must have rested on the bottom, showing that even a small shell could sink to the bottom, or lie there, which could not be was there any truth in this theory of suspension on account of density.

MINERAL RESOURCES OF THE “PLAINS.”—A late issue of the San Francisco (Cal.) *Price Current* remarks:—We have before alluded to the many advantages likely to result from the establishment of mail routes across the continent. Not the least among these, is the development of the mineral wealth of the country traversed. Iron, copper and lead abound in numerous sections. On the Sweet-water river, there are vast hills that are almost pure copper. The hills near the head of Goose creek are pure iron. Adjacent to these hills, on what is called the West Fork, gold has been found in abundance, a fact not lately discovered, since as far back as 1851 an emigrant took out, in less than a week, over \$7,000. The Black Hills south of the Platte river, are also believed to be very rich. That there is gold there, has been demonstrated. Indeed, the whole basin of mountains running from the Platte, as far south as the Rio del Norte, contains gold. Forty miles west of Santa Fe are the old Spanish mines, called *Placer*. They have been worked for nearly a century, and yet pay well.

PINS AND NEEDLES.—The manufacture of the indispensable little pin was commenced in the United States between 1812 and 1820; since which time the business has extended greatly, and several patents for the manufacture of pins have been taken out. The manufacture in England and other parts of Europe is conducted upon improvements made here. Notwithstanding the extent of our own production, the United States imported in 1856 pins to the value of \$40,255, while in the same year there were imported into this country needles to the amount of \$246,100. Needles were first made in England in the time of “Bloody Mary,” by a negro man again but as he would not impart his secret, it was lost at his death, and not recovered again until 1568, in the reign of Queen Elizabeth, when a German brought the art to the English, who have since brought it to the greatest perfection. The construction of a needle requires about one hundred and twenty operations, but they are rapidly and uninterruptedly successive.

The Young Ruralist.

A YOUNG FARMER.

MESSES. EDITOR.—I will try my hand at the pen, although not a writer, but a mechanic turned farmer. As it is your province to do good in the world, I thought I would contribute my mite to the *RURAL*.

I know it is common for almost every one to find fault with his condition in life, and all are ready to leave their present one for another, not realizing that a new profession is attended with many difficulties not foreseen, and that, consequently, cannot be guarded against. Therefore, I would say to all, stick to your present business if it is an honorable one and yields you a support, and do not shift until you are convinced that you are not suited for the business you follow. If you want to get a living without work you will have hardships to undergo still.

Now I must speak of my experience as a Young Ruralist. I left my former trade to regain my health, which had become impaired by a close attention to business, and left the Eastern part of York State for Broome Co., where I purchased a farm and commenced work in a new profession. That I met with discouragements you can imagine, but, notwithstanding, I have regained my health, and have made some progress in farming, as carried on here. I planted my corn the 2d of June; it grew and promised well, but was cut off by an early frost the 23d of September. I had a fine piece of buckwheat, and this, too, was cut off. My spring wheat was good, grass light, oats destroyed mostly by drouth and grasshoppers.

Now, young farmers, what can you say of such a start? For my part, I say, “try, try again.” So, I have sown a lot of rye that bids fair; but I will await the result. Don't let my experience frighten you. If you take the *RURAL*, you may hear from me again.

PRESERVANCE.

Nantleoke Springs, Broome Co., N. Y., 1858.

INTERESTING ARITHMETICAL FACTS.

MESSES. EDITOR.—I have often found the following simple rule, to find the square inches in a given circle, or the solid contents of a round stick of timber, or tub, or cistern, very convenient, and within the ability of any school-boy who has worked the rule of three:

As 14 is to 11, so is the diameter multiplied by itself.

Thus 14 :	11 :	58
		88
		464
		290
		3,364
		11
14) 37,000 (2,643		sq. inches, nearly.
		28
		90
		84
		60
		66
		44
		42
		2

If the article to be estimated is tapering, get the dimension of half the height or length. It is well enough to know, in measuring bins for grain, that each cubic foot is very near a bushel. Also, that 18 square feet and 1 foot deep, in a well settled mow, will make a ton of hay.

I should like if some of the boys would find out the reason, or the rationale, of the following result of figures:—Any sum multiplied by 5, or divided by 2, by adding an 0, produces the same quotient.

Thus: 805	23,050
6	1,825
1,925	

A man had \$600 which he bequeathed to his four sons, as follows:—To the first $\frac{1}{2}$; the second $\frac{1}{3}$; the third $\frac{1}{4}$; to the fourth $\frac{1}{5}$, and there was \$30 left. They say figures won't lie. Boys, how is this?

JUVENIS.

STUDYING LATIN, AGAIN.

To R. W. C., *Lionia, N. Y.*—In reading your remarks or queries in regard to the study of the Latin, or any dead language, also, those of Mr. Editor, I felt very much interest in your decision in the matter. I advise you to read the question which Mr. Editor has asked, as to the benefit to be derived from such study, first—and his answer, last. If you read them as he has given them, I fear that you will be in an error in your decision. If you have so good an opportunity to study Latin, as you now have, I think that you will never regret having studied it, even if you do not pursue a full course. But I fear that you will regret, in future years, if you do not. I have studied the Latin language some, and have received much benefit from it, viz., in the discipline of my mind, and a better understanding of our own language. Not that I propose to use the very “highest sounding words” in all my conversation with the world, but I wish to understand what I hear and read, which I consider is of very great importance, at present. I intend to study some one or more of the languages of the present day, and perhaps some more of the others. I wish to ask, Mr. Editor, have you ever pursued a course of study in either of the Dead Languages? If you do not favor their study, for a farmer, why do you make use of the Latin words and phrases that you do?

H. H. F.

Albion, N. Y., 1858.

REMARKS.—H. H. F. entertains opinions somewhat at variance with those expressed by us in reply to the query of R. W. C., as published in the *RURAL* of the 4th inst., viz., “whether more benefit could not be derived (as a farmer) from the study of Chemistry, Natural Philosophy, etc., than from Latin?” and gives his own views upon the subject. We are glad to witness this freedom of thought and expression on the part of Young Ruralists—read, inwardly digest, and form conclusions, not from the assertions of this or that individual, but from the teachings of experience. H. H. F. puts forth one or two questions. To the first, the response is yes, and we would be willing to give “considerable help” could we make a trade for some of the languages that have a little life in them. To the second, when it can conveniently be avoided, seldom do.

ROCHESTER, N. Y., DECEMBER 18, 1858.

THE RURAL FOR 1859.

New Volume, New Dress, New Club Terms!

[As this is the last full number of our present volume, (the next comprising Index, &c.), we copy the following from a recent Rural Supplement—inviting a perusal, and such action on the part of the reader as seemeth proper:]

HAVING resolved that the Tenth Volume of the Rural New-Yorker, for 1859, shall be "Excellent" in both Contents and Appearance—and so reduced its club rates as to place the paper within the reach and means of all,—we cordially invite its Subscribers and Friends everywhere to aid in increasing its circulation and maintaining its pre-eminence as the BEST FARM AND FISHING JOURNAL IN AMERICA. The reduction in club terms will be a DECIDED BENEFIT to the great mass of subscribers, and lessen our receipts many thousand dollars on the number of copies now published. But we are content a part or all of this will be made up by ADDITIONS to our circulation—as it certainly will if the friends of the Rural and its objects, near and distant, will kindly lend their influence to increase its subscription list in their respective localities. We have abolished the plan of offering LARGES premiums to be taken by a few individuals, and now give liberal gratuities to EACH and ALL in proportion to their efforts and success.

We not only address present Subscribers and Friends, but thousands of others who we believe feel an interest in promoting the Cause and Objects advocated by the Rural. We therefore frankly ask all to whom this Supplement is mailed—and we purpose sending it to numerous influential and progressive Farmers and Horticulturists all over the land, as well as to many Post-Masters, Merchants, Clergymen, Teachers, &c.—to lend such encouragement in behalf of the Rural as may be consistent with their views and engagements.—Those unacquainted with the paper are invited to give any number of it a careful examination, (for we do not issue any extra-attractive numbers, as specimens, but endeavor to render each and every one good and useful,) and then decide, upon its merits, whether it is entitled to the encouragement and support of the friends of Improvement and a Pure and Useful Literature.

FRIENDS OF THE RURAL NEW-YORKER! You can if you will, greatly aid in augmenting its circulation, influence and usefulness—and we ask that you will with much confidence, never having appealed to you in vain. All that is necessary is a little personal effort among your neighbors and acquaintances. Every reader of the Rural can obtain from one to ten, thirty or fifty subscribers—and if its friends will only make "a long pull, a strong pull, and a pull all together," it will, on or soon after its Tenth Birth-Day—the first of January ensuing—have full (a Hundred Thousand Subscribers! What say, tried friends, and new ones—you to whom we are already indebted for manifold and most substantial favors, and you also to whom we have but recently or only now been introduced—will you enter the arena in behalf of the mo-

RURAL, LITERARY AND FAMILY WEEKLY of America? The Rural has a GOOD NAME through all the land, we are proud to know;—none say "trash," "humbug," or "mad dog" of a sheet which has ever and always "defended the right," and ignored, condemned and exposed the wrong—which has constantly and zealously sought to promote the best interests of Individuals, Families and Communities. The Rural has accomplished some good in its day to both the risen and rising generation—how much can never be estimated—and its power and influence for good can be immensely increased. It is a GOOD PAPER TO WORK FOR, as its influence is in the right direction. Reader, shall it have your aid? We pause for your decision, which we confidently believe will be in its behalf—only adding that NOW IS THE TIME FOR ACTION!

The President's Message.

THIS, of its kind, is one of the longest documents ever inflicted upon Congress or the people. To publish it entire, would require fully two-thirds of a single issue, and as we could not devote such space, we will endeavor to give Rural readers a clear idea of its general drift, in as little room as possible.

Kansas is the opening feature—the story of the agitation is rehearsed, and the President argues in favor of the course he pursued. He congratulates the country on the contrast of the agitation which existed in Kansas a year ago, with the peace and quiet which now prevails. He refers to the Leecompton Constitution, and although that Constitution has been rejected by an overwhelming vote of the people, he still thinks that his former position in regard to it was right. He thinks that if Kansas had been admitted with that Constitution, the same quiet would have been secured at an earlier day.—The bill of Mr. English he signed because he was willing to accede to any other constitutional mode of settlement, and thinks that when she again applies, she will have the population that will require. In regard to this clause, the President remarks:—"This excellent provision, which Congress has applied to Kansas, ought to be extended and rendered applicable to all Territories which may hereafter seek admission into the Union." This branch of the subject is argued at length. The passage of a general law, so that no State shall be admitted unless she has population sufficient to entitle her to one representative, is recommended.

Utah next claims attention, and the country is congratulated with the favorable condition of affairs there, but a year since, bloody civil war was threatened.

Our Foreign Relations are next in order, and we are congratulated upon the recent treaties with China and Japan. The neutral policy of the United States in Eastern Asia, is advocated. With Great Britain our relations are very satisfactory. On this point the President says:—"It is my earnest desire that every misunderstanding with the Government of Great Britain should be amicably and speedily adjusted. It has been the misfortune of both countries, almost every since the period of the Revolution, to have been annoyed by a succession of irritating and dangerous questions, threatening their friendly relations. This has partially prevented the full development of those feelings of mutual friendship between the people of the two countries, so natural in themselves, and so conducive to their common interests. Any serious interruption of the commerce between the United States and Great Britain would be equally injurious to both. In fact, no two nations have ever existed on the face of the earth, which could do each other so much good or so much harm."

"Entertaining these sentiments, I am gratified to inform you that the long-pending controversy between the two Governments, in relation to the question of visitation and search, has been amicably adjusted. The claim on the part of Great Britain, forcibly to visit American vessels on the high seas in time of peace, could not be sustained under the law of nations, and it had been overruled by her own most eminent jurists."

Large space is given to the discussion of our relations with Spain, Cuba and her destiny being involved in the question. The insults of Spanish officials to the United States generally, and their repeated injuries inflicted upon the persons and property of American citizens have never been redressed, and all attempts to obtain any acknowledgment upon the part of the home government, have been baffled. From this point the President unfolds the great necessity that exists for the United States obtaining possession of Cuba. First, The Slave Trade can never be wholly suppressed while Cuba opens her ports to the traffic. This market is a constant source of injury and annoyance to Americans, and the cost of keeping a fleet in the Gulf, to intercept slavers, and upon the coast of Africa—as we are bound to do by treaty with Great Britain—is a very heavy expenditure both of life and treasure. Second, its geographical position, commanding, as it does, the mouth of the Mississippi, makes it a question of vital importance, and on this point alone it is the policy of the Government to obtain its possession. The mode of procuring this "Gem of the Antilles," is by purchase.

That country of anarchy and civil war—Mexico—is next taken up, and the President, before putting her down again, proposes that we should take a large slice and care for it, as it is evident it can receive no sustenance from other quarters. After a review of the constant injury that the American government and American citizens have been subjected to—consisting of murders, imprisonments, and plunder—and that no effort has been made, either to punish these outrages or prevent their repetition, the President says:—"Abundant cause now undoubtedly exists for a resort to hostilities against the Government still holding possession of the capital. Should they succeed in subverting the Constitutional forces, all reasonable hope will then have expired of a peaceful settlement of our difficulties."

"On the other hand, should the Constitutional party prevail, and their authority be established over the Republic, there is reason to hope that they will be animated by a less unfriendly spirit, and may grant that redress to American citizens which justice requires, so far as they may possess the means. But for this expectation, I should at once have recommended to Congress to grant the necessary power to the President to take possession of a sufficient portion of the remote and unsettled territory of Mexico, to be held in pledge until our injuries should be redressed and our just demands satisfied. We have already exhausted every milder means of obtaining justice. In such a case, this remedy of reprisals is recognized by the law of nations, not only as just to itself, but as a means of preventing actual war."

For Arizona the establishment of a Territorial Government is recommended, and the formation of military posts in Sonora and Chihuahua—be-

cause Mexico is unable to protect her own frontier—is also advocated.

From Mexico we naturally drop down to Nicaragua, and for this, as well as the other routes across the Isthmus, the President recommends the passage of an act authorizing him, "under such restrictions as they may deem proper, to employ the land and naval forces of the United States in preventing the transit from being obstructed or closed by lawless violence, and in protecting the lives and property of American citizens traveling thereupon, requiring at the same time that these forces shall be withdrawn the moment the danger shall have passed away."

The Expedition against Paraguay is the next topic, and the President states he has complied with the requirements of the act passed by Congress on the 12th of July last. A Commissioner has been sent with full power to settle all differences in an amicable and peaceful manner if practicable. If the Paraguayan Government fail to make just atonement for the wrongs they have committed against the United States, the strong arm of force must be employed. For this purpose the Secretary of the Navy has dispatched a fleet to rendezvous near Buenos Ayres.

The Banking System of our country meets with little favor. In the opinion of the President, "these periodical financial revolutions must continue to recur at intervals so long as our present unbounded system of bank credit prevails." The passage of a uniform Bankrupt Law, applicable to Banking Institutions, is recommended.

The President reviews the official documents of the Secretaries of the different Departments, but as all matters of general importance by them contained, are given in connection with this review, we will not go into the matter further. The reader can turn to the following Reports and draw his own conclusions as to the condition of our country:

POST-OFFICE DEPARTMENT.

The whole number of post-offices on 30th June last was 21,977, of which 400 are of the class denominated presidential; whole number established during the last fiscal year, 2,121, number discontinued, 1,591; number of post-masters appointed, 8,284. Of the 4,595 were to fill vacancies occasioned by resignation, 993 by removal, 274 by death, 292 by change of names and sites, and 2,121 on establishment of new offices. Whole number of offices December 1, 1858, 28,673. On the 30th June last there were in operation 8,290 mail routes. The number of contracts was 7,048. The length of these routes is estimated at 250,693 miles. Total amount of transportation 78,765,461 miles, and cost \$7,365,418.

Compared with the service reported 30th June, 1857, there is an addition of 18,002 miles to the length of routes, and \$1,173,372 to the cost. The total estimates for the current year are \$10,615,947. The total expenditures for the fiscal year ending June 30, 1858, amounted to \$12,722,470. The estimated receipts and expenditures in 1859:—Expenditures, \$14,776,620; means \$11,994,393; deficiency \$4,882,127.

The Franchise Privilege now allowed to members of Congress receives a share of attention, and it is proposed, in lieu thereof, to furnish the members with postage stamps to be used on all letters, public documents and packets transmitted by the mail, and keep an account of the stamps furnished to each member, to be paid for out of the contingent fund of the House. It is further proposed that all letters and packets, except newspapers addressed to members of Congress, shall be pre-paid at the mailing office. In this way the Department would be compensated for the service rendered, without a resort to the contingency fund of daily minute accounts of the postage chargeable on such mail matter.

To avoid dissatisfaction and the practical inconvenience of having different rates of postage, regulated by distances, it is submitted whether one uniform rate of five cents for all distances would not enlarge the usefulness of the Department, and diminish, if it did not entirely prevent, such heavy drafts upon the treasury, and best promote the interest and convenience of the people.

THE TREASURY.

The receipts into the Treasury from all sources during the fiscal year ending 30th June, 1858, including the treasury notes authorized by the act of December 23, 1857, were \$70,273,869 49, which amount with the balance of \$17,170,124 27 remaining in the treasury at the commencement of the year, made an aggregate for the service of the year of \$87,988,993 86. The public expenditures during the fiscal year ending June 30, 1858, amounted to \$85,667 70, of which \$9,884,637 99 were applied to the payment of the public debt, and the redemption of treasury notes.

The five steam sloops-of-war, authorized by the act of 1847, will soon be completed. The seven steam screw sloops-of-war, under the act of 1855, are in a state of great progress. Five of them are to be launched during the present month, and the last in January next. All present month, and the last in January next. All present month, and the last in January next. All present month, and the last in January next.

The authorized strength of the army, as posted, is 18,165, but the actual strength on July 1st, was 17,193. These troops compose the whole numerical force of our army, distributed through the States and Territories of the entire Confederacy, manning all the fortifications occupied by troops, holding all posts now garrisoned, defending all our extended frontiers, and protecting, as far as makes war, at least to the extent of our present position, the Pacific. The disbursements amount to nearly \$10,000,000 in the Quarter-Master's Department. Every voucher has been filed, with the exception of \$250,000. Nothing will be lost.

Attention is called to necessity of providing for the payment of claims brought against the Government by the people of the States and Territories for services heretofore rendered by volunteer forces in the suppression of Indian hostilities. The Secretary says he has attempted, as far as possible, to meet the just wishes of Congress in reducing the expenses, and the estimates of the next fiscal year are less than the appropriations for the last by the sum of \$9,180,488. They are less than the estimates laid out by Congress at the last session by the sum of \$2,736,493. The Secretary says he has attempted, as far as possible, to meet the just wishes of Congress in reducing the expenses, and the estimates of the next fiscal year are less than the appropriations for the last by the sum of \$9,180,488. They are less than the estimates laid out by Congress at the last session by the sum of \$2,736,493.

From the 1st of January to the 30th September, 1858, 4,991 applications for patents were received and 600 patents filed, against 4,995 applications and 820 patents for the corresponding quarter of last year. During the same period, 2,816 patents were issued, 15 extensions granted, and 1,266 applications rejected.

INDIAN AFFAIRS.

The Commissioner states that the whole number of Indians within our limits is estimated at about 350,000. The whole number of tribes is estimated at 175, with 44 of which we have treaty engagements. The number of ratified Indian treaties since the adoption of the Constitution is 393, nearly all of which contain provisions still in force. The quantity of land acquired by these treaties is about 531,163,186 acres. The entire cost of fulfilling these treaties will be \$49,816,844. The Commissioner states that on the 30th June last he has marked our policy towards the Indians from the

very beginning viz.—1st, Their removal from place to place, as our population advances; 2d, The assignment of too great an extent of territory to be held by them in common; 3d, The allowance of large sums of money as annuities.

He recommends that the tribes should be permanently located upon reservations embracing not more than is necessary for actual occupancy; to divide the land among them in severalty; to require that they should live upon and cultivate the land thus assigned; to give them in lieu of money annuities, stock animals, agricultural implements, mechanic shops, manual labor schools, &c. He recommends the ratification of the treaties made in 1855 with the Indians of Washington and Oregon Territories, as a means of preventing the recurrence of hostilities.

GENERAL LAND OFFICE.

The report covers a period of five quarters, ending September 30th, 1858. During that period there were surveyed of the public lands 15,208,376 acres, which with former surveys, make a quantity of 61,961,046 acres of the public lands surveyed and ready for market on the 30th of September, 1858, which had never been offered at public sale. During the same period there were sold, for cash, 4,604,919 acres, from which \$2,634,193 was realized.

News Paragraphs.

Fat deer and wild turkeys, weighing sometimes twenty pounds, are the style of game taken near Owosso, Shiawassee county, Michigan. One hunter took four deer and twenty-two turkeys.

The government of the United States is about to erect a mammoth foundry on the Pacific coast. It will be located at the Mare Island Navy Yard, near San Francisco.

The "Back Bay" at Boston, is being filled up by the corporation, and will be sold in building lots. The bay is a shallow, useless sheet, and will be the finest quarter of Boston, when filled up and built upon.

The Times states that the speculations in real estate in New York continue, and the rapid rise of prices in many cases has equalled the great operations of 1836.

The Fresno Indians in California are killing their "medicine men." They declare them to be witches—that they cannot cure the sick, and that there will be no more rain or grass seen until they are exterminated. Seven or eight of their doctors have, in consequence, already suffered martyrdom.

A COMPANY of one thousand Germans is being formed on the Rhine and Moselle, with the intention of emigrating to Mariposa, California, and settling on Fremont's claim, for the purpose of mining and farming. Each of the one thousand members is to furnish \$1,000, making a capital of \$1,000,000, but they may dispose of \$100 shares to third parties.

If the figures in the London Times are correct, Great Britain uses more cotton than all the rest of the world. The proportions of the raw material used in the cotton consuming countries are: out of every hundred pounds Great Britain 51.23, France 13.24, Northern Europe 6.84, the United States 23.58, other countries 5.06.

The Japanese officials have undertaken to learn English in five years, after which time all communications with that court are to be in our mother tongue. It is to be hoped that the authorities at the State Office in Washington will understand this to be a reciprocal duty, and that they will immediately apply themselves to the pleasant and useful task of mastering the Nippon dialect.

A NEW and valuable gold mine is said to have been recently discovered in Montgomery county, N. C., from which the owner, at an expense of \$300, secured \$30,000 worth of gold in three months.

A BILL has passed the House of Representatives of Georgia by a vote of 58 to 52, prohibiting the marriage of first cousins, under a severe penalty and cutting of the inheritance of issue.

REMARKABLE LONGEVITY.—In the town of Lodi, Seneca Co., N. Y., in one neighborhood, may be found four persons over 80 years of age, six over 76, and about the same number over 70. Three have died within the past few years who were over 90. In one family there are four brothers and a sister living, two of the brothers now in Lenawee Co., Mich., whose ages respectively are 87, 83, 80, 77, and 69 years, making a total of 306 years. The wives of the four brothers are all living, two being over 80 years old, and the others respectively 72 and 68. They have been married an aggregate of over 300 years. One brother died a few years since nearly 70, and a sister over 73. One of the two brothers in Lodi has seen his great-grandchildren, and at the present time (at the advanced age of 83) "his eyes are not dim, nor his natural strength greatly abated," and he bids as fair to live in the full enjoyment of a good state of health and of mental faculties for many years, as at the age of 60. So writes a correspondent.

ONE HUNDRED AND FIFTY BUSHELS OF CHARCOAL ON FIRE.—The Auburn Advertiser, of the 27th ult., says:—"At about 10 o'clock this morning a large pile of charcoal in the cellar of the American Hotel, consisting of some 150 bushels was discovered to be on fire. The fumes spread through the entire building, affecting the inmates to such a degree that they found it necessary to escape from the building, and some were much so much affected as to require a physician. If it had occurred in the night, when all in the house were asleep, it must have resulted in most shocking and fatal consequences."

BRAZIL.—Brazil now occupies a very respectable position in the list of powerful nations. Her government is stable and permanent. There is considerable popular liberty, and the masses of her people are progressing rapidly in civilization. Her military and naval resources are large. She has a fleet of sixty-two vessels of war, of which thirty are fine steamers. Her navy is more efficient and larger than ours. She has a standing army of 26,000 men, and her national guard numbers 400,000.

A NEW COUNTERFEIT BILL.—The Hamilton Spectator puts the public on their guard against counterfeit two dollar bills on the Bank of Upper Canada, that have recently made their appearance. They are produced by the photographic art, and are, of course fac similes of the genuine bills, in everything except the quality of the paper, and the dingy blackness of the coloring. They are easily detected by a comparison with the genuine notes, and by bearing in mind, also, that the paper is somewhat whiter in the bogus bills.

The News Condenser.

—Earthquakes are reported in Spain and Portugal.

—A Kentuckian has been marrying a Kickapoo squaw.

—Cholera is raging in Japan, and carrying off thousands.

—There are 35,000 places where alcohol is sold in Boston.

—The Great Shad has made its appearance in the Savannah River.

—D. Colbert has been elected Governor of the Chickasaw nation.

—Four otters were killed in Luzerne county, Pa., week before last.

—The corn crop in Italy is a failure, and prices there are on the rise.

—Influenza prevails to a considerable extent at present in Louisville, Ky.

—The Mayor of Philadelphia has ordered the arrest of all street beggars.

—There is a general agitation in Asiatic Turkey. Insurrections are frequent.

—More than 300 lads are seeking appointments at Albany as Legislative pages.

—There are five hundred applicants for the ten vacant cadetships at West Point.

—Santa Anna's wife has left him, and is now the "reigning belle" of Havana.

—Three small whales were captured a few days ago off Narragansett, Long Island.

—Sir Edward Bulwer Lytton has been elected Lord Rector of the Glasgow University.

—Two lines of stages are already advertised to leave eastern Kansas for the gold region.

—Arrangements are now being made to commence washing for diamonds in Georgia.

—Nearly four hundred men were discharged from the Brooklyn Navy Yard Wednesday.

—The salaries of the clergy of the United States do not average five hundred dollars a year.

—There is at present \$150,000 worth of dried fruit in Nashville, Tenn., awaiting shipment.

—A Kentucky drover says that he lost \$3,000 in the gambling halls of New York last week.

—They are now talking of the Astor House as a suitable site for a post office in New York.

—One hundred thousand hides a month are shipped from the La Platte River, S. America.

—Watermelons and shad are among the luxuries of the Columbia, Geo., market at present.

—In the city of Milwaukee there are 13,000 children who are constant attendants at school.

—The population of Cincinnati in 1851 was 28,831; the city now has a population of 275,000.

—The public debt of the consolidated city of Philadelphia amounts to twenty millions of dollars.

—A Shoe Manufacturer in Boston has invented, and is making boots expressly for ladies to skate with.

—During October the coinage at the New Orleans mint amounted to \$571,661, and the deposits \$751,994.

—Meetings in the aid of the new reform government continue to be held in various parts of England.

—Pierre Descombe, a Frenchman, died at St. Roch, Canada, on the 15th ult., at the great age of 112 years.

—The Middlesex company at Lowell are making heavy woolen Balmoral skirts for the girls to skate in this winter.

—Three persons returning from Pike's Peak bring \$300 or \$400 in scale gold with them, found on Platte river.

—Cpl. Fremont's Mariposa claim yields from \$1500 to \$3000 every week. The quartz mill is worked by steam.

—A bill has been reported in the North Carolina Legislature to remove the free colored population from the State.

—The Belgian journals record the marriage of four brothers to four sisters, celebrated at the same time, at Mons.

—A Black Hawk colt, five months old, was taken out in the steamship Canada, on the 1st. Its destination is Scotland.

—A Texas paper mentions having received a letter from a friend, accompanied with the scalp of a Comanche Indian.

—Two thousand mackerel were taken in one haul off Provincetown last week, and in three nights 10,000 were taken.

—A new Snow Shoe Club is being formed in Montreal which it is expected will compete successfully with the old one.

—A new census of the city of Raleigh, N. C., has been completed. The aggregate population, white and black, is only 4,362.

—Forty-two thousand bushels of potatoes have been received at the port of Boston, from the British provinces, since Nov. 22d.

—The California wine crop of this year promises to exceed in quantity, and excel in quality, the product of any previous vintage.

—General Scott, in his report, will, it is understood, recommend one or two additional regiments, to be used on the frontiers.

—The estate of the late Ebenezer Francis, of Boston, is found to amount to \$3,483,000, of which sum \$2,200,000 is cash on deposit.

—The Hartford, a fine United States steam sloop-of-war, was launched at the Charlestown, Mass., Navy Yard on Monday week.

—Mr. Foster Hale, the inventor of raised letters for the use of the blind, fell down dead on a pavement in Selma, Ala., on the 28th ult.

—On Christmas Day a large hog is to be guessed for in New Brunswick, N. J. The man who guesses nearest to his weight is to have him.

—The Pope has thrown British and Roman sportsmen into despair by decreeing that there shall be no more fox hunting at Rome.

—In the Cincinnati Common Pleas there are just now no fewer than one hundred and seventy-five applications for divorce on the docket.

—A pork packer of New Albany, Ind., it is stated, has cleared \$15,000 this season on a single lot of hogs purchased by him at \$5 net.

—A girl twelve years of age fell upon a pair of scissars in New York, while playing. The jugular vein was pierced, and she died.

—A boy, eleven years of age, was arraigned before the Police Court at Boston, last week, charged with being a common drunkard.

—Mrs. Edwards was frightened to death in Washington, last week, by a dog attempting to seize her as she was passing along the street.

—Colomini is said to have received an offer of marriage from a fashionable and very young New Yorker, since her arrival in this country.

—On Thursday last messages were sent without interruption over the telegraph wires from New York to New Orleans, a distance of 1700 miles.

—A lady, eighty years of age, made the journey overland, from Illinois to California, via Salt Lake, and reached Sacramento in good health.

—Quite a number of Americans have died lately at Paris. Three corpses came in the Arago, Hon. B. F. Butler, Mr. Hodges, and Mr. Tuttle.

—A jury was burned in effigy at Springfield, Ky., last week, because they failed to convict on circumstantial evidence a man accused of murder.

Moore's Rural New-Yorker.

"EXCELSIOR"

TERMS OF THE RURAL-1899.

GREAT REDUCTION TO CLUBS

Single Copy, One Year,	\$5
Three Copies,	\$10
Six " " " " " "	\$15
Ten " " " " " "	\$22
Twenty " " " " " "	\$38
Thirty-Two " " " " " "	\$40

And any additional number at the latter rate—only \$1.25 per copy!—with a free copy for every Ten Subscribers over Thirty.

LIBERAL GRATUITIES.

In addition to the extra copies above offered, and any Premiums which we may hereafter offer for subscribers to the Tenth Volume of the RURAL NEW-YORKER, we will give to each of the One Hundred Persons sending the first list of THIRTY or more yearly subscribers to the RURAL after this date (remitting payment at our club rate—\$1.25 per copy), a bound volume of the RURAL for 1899, price \$3.00, or \$2 in Agricultural Books, post paid.

To each of the One Hundred Persons sending the first list of TEN, SIXTEEN or TWENTY Subscribers as above, remitting payment according to our terms, we will give either another extra copy of the RURAL, or \$1.60 in Ag. Books, post paid, or a Cross of the Washington Medalion Penn, post paid, as preferred by the persons entitled.

PUBLISHER'S NOTICES.

PLenty of Time!—In answer to two or three recent inquiries, we would state there is yet abundant time to secure the Liberal Gratuities we offer for the first 100 lists of 30 subscribers, and first 100 of 10, 16, or 20. Indeed, as club lists do not usually come in to any extent until after Dec. 1st, we presume all who remit before the 10th or 16th will be sure of the extra premiums, and perhaps those who send as late as the 20th or 25th. But as there are indications of a rush this year, competitors should remit as early as possible.

Any person who remits pay for a club of 10, 16 or 20 at the specified rates for such club, and adds a sufficient number within one month thereafter can avail himself of the advantage of the lower price of large club, and retain the amount overpaid. Thus, a person remitting \$16 for 10 copies, could obtain 10 copies more within a month by sending only \$11.

The RURAL as a Present.—Our readers are reminded that in all cases where the RURAL is sent to a distant friend or relative, as a present, we only charge the lowest club price, \$1.25. Our lowest prices for copies sent to Canada, is \$1.37½, and to Europe, \$2.25—the extra charge being for postage.

In ordering the RURAL please send us the best money conveniently obtainable, and do not forget to give your full address—the name of Post-Office, and also State, Territory, or Province.

"Rural" Letters from the People.

MARY School Teachers are aiding the RURAL materially. We have recently received several letters like unto this from Mr. Wm. C. SWANWILL, of Kalamazoo Co., Mich.:—"I am engaged in teaching, and as my facilities for circulating, and perhaps inducing some to subscribe for your valuable New-Yorker, are quite ample, I have thought it would be as great a benefit as lay in my power to confer to bring to the notice of the inhabitants of my district 'the merits and real worth' of this invaluable journal. I consider the RURAL as almost indispensable to every family who would cultivate the tone of the higher and nobler feelings of the soul. If you see fit, you may send me a dozen or twenty copies, and I will distribute them."

Mr. E. W. DAWSON, of Saginaw Co., Mich., writes:—"I have resolved that the RURAL shall have more attention and more subscribers in this place, as it deserves, for I am sure that all should take it, hard times or no hard times. Please send me a show-bill and a few numbers for distribution, and I will try to render a good account."

Mr. THOS. J. MARRO, of Cayuga Co., after requesting some specimen numbers, show-bills, &c., writes as follows:—"I may expect three times as many names from this place as you have ever had. I have already a fair list. I have that confidence with the RURAL that I have offered it to some new subscribers on the condition that if they were not satisfied at the end of the year that they had received the worth of their money, I would refund it if they would return me the papers. Is it promising too much?" [No—you are right; we will endorse all such offers.]

Thus "Boys" are ardent friends of the RURAL, and doing their share to extend its circulation. After requesting show-bills, &c., to aid him in getting up a club, A. J. RICHES, of Genesee Co., writes:—"The RURAL is a great favorite among 'us boys,' and were it in my power I should like to place in the hands of every farmer, and not every farmer only, but every family—in the United States. I take a great deal of pleasure in reading the RURAL, and hope some day, if God spares my life, to be a farmer. But I will close by wishing you and your invaluable paper a long life."

One of our former subscribers, who has located "Out West," in Illinois, sends pay for specimen bills, &c., and says:—"I have read five regular papers during the present year, all of them literary sheets, except one, and filled up with trashy matter, such as love yarns, &c. Having become sick of such reading, for a change I have been looking over my old RURALs, and find such good reading in them that I have made up my mind that if I do not take but one paper next year, that one shall be the RURAL."

Mr. A. BOAG, of Onondago Co., writes thus appreciatively and encouragingly of the RURAL:—"As I have been a constant reader of your excellent paper ever since the days of the infancy, I feel great anxiety for its prosperity. We have over here a day without the ever-welcome weekly 'RURAL' visitor since its commencement, nor would I be, let the price be what it may. I can truly say that I have anxiously watched its progress as, step by step, it has steadily advanced towards a state of the greatest perfection, and my expectations have been fully realized in the improvements of its appearance and worth of its contents. It has struggled nobly and bravely for supremacy, it has surmounted every obstacle that impeded its course, and gained for itself a wide-spread and honorable name, one we trust that will never be obliterated. I have often spoken to my friends and neighbors of the worth of the RURAL and urged them to become its subscribers, but the most of their answers were, 'I should like to paper, but it comes so high I cannot afford it'—not thinking that it is a great deal cheaper than those seventy-five cent or dollar trashy sheets that they are willing to take all day long. If they could only once be induced to make a change, (which I am in hopes they soon will be,) I am sure they never would regret it, for it is a paper that meets the wants of every family, and all that have had a chance to read it, as far as I have heard, are loud in its praise. I was glad to see that you had reduced the club prices, not but that it was well worth \$1.50 and cheap, too, but now the people will have no excuse, and I am sure that a great many names will be added to your list. If you will please send me some specimen numbers, prospectuses, &c., I will go into it heart and hand, and form as large a club as possible, thereby benefiting my neighbors and enhancing the circulation of the RURAL."

Foreign Intelligence.

Arrival of the City of Washington.

A TELEGRAM dated St. John, N. F., 9th inst., says the American steamship City of Washington, Capt. Petrie, from Liverpool, on Wednesday, the 24th ult., passed Cape Race at 3 o'clock on Tuesday afternoon.

GREAT BRITAIN.—There was no news of the missing steamer Indian Empire. Insurance was being effected upon her at 25 per cent. The London Morning Post, anti Ministerial, announces the recall of Lord Napier and the promotion of Mr. Lyons from Florence to Washington. It says the assigned cause of his recall, is Lord Napier's tendency in favor of the Monroe doctrine. The Globe, anti Ministerial, confirms the report, but says Lord Napier will have a European mission, the government merely making the change in the regular course of diplomatic promotion, being perfectly satisfied with Lord Napier's course.

The overdue ship Agincourt, with 70,000 ounces of gold, had arrived from Melbourne.

The Independence Beige says the English Cabinet have notified Holland of its refusal to assume a protectorate of Sarawak.

FRANCE.—The trial of Montalambert was commenced at Paris on the 24th.

The press had been specially forbidden to take notes. It is also forbidden to discuss religious topics.

The Sardinian government follows the example of France in storing corn.

Diplomatic relations were expected to be resumed between Prussia and Switzerland.

American agents were said to be persuading Denmark to sell St. Thomas and St. John Islands to the United States.

Commercial Intelligence.

BREASTERS.—Flour shows a declining tendency, though prices are nominally unchanged. Western canal 20s. Ohio 22s. 24s. Wheat firm, with upward tendency. Quotations nominally 4s. 6d. Western. White 6s. 3d. Corned meat 10s. 11s. 12s. nominal for mixed 2s. Yellow 2s. White 3s. 11s. 32s.

California Intelligence.

Arrival of the Quaker City.

The Quaker City arrived at New Orleans on the 7th inst., with California dates of the 20th ult., via the Tehuantepec route.

Business continues to improve at San Francisco. Eight ships had arrived from Atlantic ports during the fortnight.

The mails hence for San Francisco, via Tehuantepec, reached their destination in eight days, including a detention of sixty hours at Acapulco.

The lighthouse was in good condition.

Ten thousand letters had been sent from San Francisco by overland mail.

The State of California had sued Wells, Fargo & Co., for the \$22,000 of the \$30,000 in script stolen from the Treasury.

Mining was good. Rain was much needed, and cattle were suffering for want of food.

The application for the appointment of a Receiver for the New Admiration mines had been denied by the Federal Courts and the injunction continued.

Rents advancing and houses scarce. Business had improved, but the markets generally were unsettled.

A cargo of 100 had arrived at Honolulu from Boston in good order. Thirty-seven Arctic whalers, with 20,500 barrels of oil, had also arrived.

THE FILLIBUSTERS MOVING.—A telegram dated Mobile, 6th inst., says:—"The schooner Susan, Captain Marcy, sailed from this port yesterday with one hundred and fifty passengers and will be provisioned, but without a clearance under pretence of being bound on a coasting voyage. Before reaching Mobile Point she was overhauled by an armed boat from the Cutter McClelland and stopped. The passengers on board threatened the Cutter man with violence, and refused to allow them to board her. Our Collector is awaiting instructions from the Treasury Department. Much indignation is manifested by the fillibusters and their friends."

Later intelligence chronicles the escape of the Susan on the 9th inst. The Revenue Cutter got aground, and when released the schooner was 400 miles on her route.

THE RURAL NEW-YORKER.—We take pleasure in referring our readers of all classes to the Prospectus of the Tenth Volume of this invaluable paper, which is sent to every subscriber free of charge. It is a paper of great value to every family, and we are glad to see that it is so generally appreciated.

On all the agricultural journals in the Union, the one which pleases us the most, the one which we consider as the most judicious, the one which we consider as the most valuable, is the RURAL NEW-YORKER. It is one of the best family newspapers we know of aside from the agricultural papers and mailer. It is a large paper, printed weekly, to the city of Rochester, at \$1 per year. It has an immense circulation, and is a great help to the farmer, and a great pleasure to the city dweller. It is a paper that every family should have, and we are glad to see that it is so generally appreciated.

RURAL NEW-YORKER OFFICE

Rochester, Dec. 18, 1898.

Flour—Fancy brands of winter wheat flour show an advance of 25 cents per barrel. Spring remains as last quoted. Little is doing except to supply local demand.

Grain—In wheat no alteration of prices. Corn shows a falling off of 1/4 cent per bushel on maximum rates of last week. Buckwheat is still advancing, having gained 1/2 cent per bushel upon our last rates quoted. Barley is unchanged in quotations and there is no one in the market with an inclination to buy.

Provisions—Heavy pork is still going up, while we note a decline of 20c per cwt. in light hogs. The market this morning is bare, the warm weather of the past two or three days having checked slaughtering. This A. M. is more like late spring than the middle of December. Shoulders (smoked) are in little better demand and have taken a step of 1/4 cent.

All other articles in our table of quotations are without change in prices.

Buckwheat is still advancing, having gained 1/2 cent per bushel upon our last rates quoted. Barley is unchanged in quotations and there is no one in the market with an inclination to buy.

Provisions—Heavy pork is still going up, while we note a decline of 20c per cwt. in light hogs. The market this morning is bare, the warm weather of the past two or three days having checked slaughtering. This A. M. is more like late spring than the middle of December. Shoulders (smoked) are in little better demand and have taken a step of 1/4 cent.

All other articles in our table of quotations are without change in prices.

Flour and Grain—Fancy brands of winter wheat flour show an advance of 25 cents per barrel. Spring remains as last quoted. Little is doing except to supply local demand.

Grain—In wheat no alteration of prices. Corn shows a falling off of 1/4 cent per bushel on maximum rates of last week. Buckwheat is still advancing, having gained 1/2 cent per bushel upon our last rates quoted. Barley is unchanged in quotations and there is no one in the market with an inclination to buy.

SICOTRY.

BY G. C. BRADDOCK.

There was who does a holy face,
And with a holy tone
Denounces all the human race
Whose creed is not his own.
No matter what his creed may be,
Betrays a narrow mind,
And sees not what he seems to see,
And honors not his kind.
To arrogate superior airs
Of sense and moral health,
And preach or teach that he who dares
Is sin-diseased from head to heel,
While you are bound for heaven,
Proves not that you are safe and well,
Nor proves him unforgiven.
Whatever else we may presume,
Men can be only men,
And should not fantastically assume
To have an angel's ken:
Which puny sighted bigots do,
In reverential ways,
And it suffices them in lieu
Of sense, and sometimes—grace.

The Sketch-Book.

LIZZIE MASON'S CHRISTMAS.

BY CAROLINE A. HOWARD.

LIZZIE MASON sat at the window of her father's large and richly furnished drawing-room, and, with her cheek pressed tightly against her jeweled fingers, gazed out upon the street. The snow was packed, crisp and hard, and the clear, winter sunshine seemed to have no effect but to brighten it, while the sleighs, which flitted hither and thither, laden with the rich and the fair, attested the enjoyment of the pleasure-loving city. Lizzie's very pretty face was darkened by a frown, and the look of resignation which wreathed her mouth would have done credit to a martyr. Something had evidently gone wrong that morning, and from the fact that there was to be a large ball on Christmas Eve, and that Lizzie held in her hand a roll of bills, we can easily surmise that she had just received a long lecture from her father on the extravagance of women in general, and his only daughter in particular, winding up with the very reluctant bestowal of fifty dollars or more for the wished-for occasion.

A little cutter, light as thistle down, and heaped with furs, dashed by, and Lizzie starts up just in time to receive a gallant bow from a fine-looking young man, and a smiling glance from a gaily dressed lady seated by his side.

"Well, there! I wonder what disagreeable thing will happen next!" she exclaimed aloud, "I thought I had had enough to vex me for one day at least. Now, there goes Ned Ritchie in his handsome sleigh with that detestable Kate Wells! I would not care if he was alone, but with her—O, dear, I wish I had never seen him! What a fool I have been to think he cared anything about me. And what a triumphant look she gave me with those black eyes that Ned so much admires—I could have crushed her! Heigh-ho! I don't suppose it entered his mind that I might like to ride this lovely morning."

The sequel to this most charming soliloquy was, that the young lady slammed the door after her, and was soon in the enjoyment of a copious shower of tears in her own room. We must try to excuse her for she was only eighteen, just from school, and Ned was her favorite among several admirers of herself and her father's money. As is generally the case, half her bitter feelings were swept away with the flood, and were replaced by more sensible thoughts. She wiped her eyes with a resolution which was truly commendable, and having looked in the glass to see that her face was not very red, she resumed her seat in the comfortable arm-chair, and thus reflected:

"How foolish I am! Why should I care for Ned Ritchie? True, he knows more, appears better, is more agreeable than any other gentleman that I know, but if I live, I dare say, I shall see plenty more as good. Eighteen last March, it seems a good many years, but it isn't so very old after all, so I've time enough before me to see any number of people I should like better.

"I'm afraid I'm very wicked and selfish. Because papa looked distressed and grumbled some when I asked for the money for my ball dress, I looked cross, and I know I said some unkind words, for papa looked back when he went out and said, with such a sorry look, 'Lizzie, I wonder sometimes if you care anything about your father except when he hands out money for your pleasure?'"

"I don't think that was fair,—he knows I think everything of him, and if he had not felt cross he would never have thought of it. Perhaps I am extravagant,—all the girls are,—but he is partly to blame for that, for he never denies me anything. He says that my education has cost so much that I ought to economize now, but now is the very time when I want money, if ever I shall, for I have just entered society, and it is expected that I shall appear as well as the rest. Dear me, I sometimes wish I was poor!"

"Do you?" said a pleasant voice, in reply to the last sentence, which was impatiently spoken aloud, and turning hastily, Lizzie met Mrs. Russell, a widow lady who was formerly her governess, and to whom she was much attached.

"I came right up, and have knocked twice, but I presume you did not hear me. How cozy and warm it is here! O, Lizzie, you would know how to appreciate your delightful home if you had been where I live this morning. I think no one can truly value the blessings they enjoy until they have contrasted them with the situation of those less fortunate."

"Tell me about it, Mrs. Russell,—you are always engaged in some charitable work. Who are your last proteges?"

"You remember Tom Flynn, who used to be Mr. Vandenberg's gardener, and who takes care of your father's lot in Greenwood? Poor Tom!—

He has not had any steady employment this two months, and I fear he is getting into bad habits. On Saturday he went off with a party of men in a sleigh. The sleigh was upset, and Tom was picked up by a farmer and brought home, having frozen both of his feet so badly as to be useless for a while.

"They are very poor, having scarcely the necessities of life, and their fuel will not last a week longer. His wife does the best she can, but she is a poor, ignorant woman, with half a dozen little ones. O, dear! our city is full of just such, and when I look around me my heart aches to think how they will have to suffer this winter in spite of all that will be done for them.

"But I must go,—I stopped to take a peep at you, on my way to the widow Taylor's. Her two youngest children have had the scarlet fever. How I pity Mary! She is just your age, Lizzie, and a lovely girl, but she is a perfect martyr to the family. Her mother is not strong, and has her hands full, so that Mary pretty much supports them all on the scanty proceeds of her school teaching."

"Don't be in a hurry, Mrs. Russell. Wait a moment, and I will go with you as far as Broadway. I was going to Stewart's to look at some lace, and I should be glad of your company on the way."

Taking a coach down Fifth Avenue to Broadway, Mrs. Russell got out at Spring street, telling Lizzie that if she would accompany her she would not stay long, and would then go with her to Stewart's. Lizzie had but a moment to think about it, and before she fairly thought whether she wished to go or not, she was on her way.

Mrs. Taylor lived on Centre street, near Spring, in a house which had once been a handsome brick residence, but like hundreds of others in New York, have fallen into decay, (as other quarters of the city become more fashionable,) and are now either cheap boarding houses, or are rented out to several families. Mrs. Taylor occupied the lower story and basement of that in which she lived.

It was their dinner hour, and she came from the kitchen to meet her visitors with a care-worn look that bespoke sleepless watchings by a sick bed and countless cares by day. Lizzie was abashed, and with natural delicacy she withdrew her attention from them, that she might not give pain by her apparent interest in the poor woman and her conversation. Glancing around the room she saw that, though poorly furnished, it contained several little articles of feminine taste, such as a work-box, a vase or two, and on the table lay some degenerate types. She took up one. It was the fair and smiling face of a girl of not more than fourteen years, and seemed strangely familiar. The next which she opened seemed the same face, but there was such an anxious, prematurely thoughtful look about it that Lizzie thought it might almost be the mother of the other. On the table lay a book—*Pope's Essay on Man*—and turning carelessly to the fly-leaf, Lizzie read "MARY TAYLOR—Miss Porter's Select School, Aug., 1849."

"Why!" she exclaimed, but checking herself instantly, no notice was taken of her surprise, and in a few moments they went out.

Brewster's splendid assortment seemed to have lost its charms for Lizzie that morning, else she was about minded, for nothing suited her, and after turning over quantities of needle-work and founcings, she went away, saying she would look at them some other day.

All that afternoon Lizzie seemed in a dream, and her fingers lingered so long over the rich slippers which she was embroidering, that she would never have finished them at that rate. She was thinking of a little, rosy-cheeked girl with beautiful curls, who used to be the pet and playmate of the girls at Miss Porter's school. The Mary Taylor that Lizzie used to know when she was about twelve years of age, was such a bright, happy child, that it seemed impossible to identify her with the pictures that she had that morning seen. Yet they must be the same. There was the old school-book from which the older girls had read and parsed, and there, in the picture of the young girl, were the same bright eyes, but the curls were gathered up. Could Mary have grown to be like that pale, thoughtful woman, whose face had looked up from the picture case with an appealing expression? She remembered that Mary had a father then, but she had neither seen or heard anything of her since they left New York for the West, years ago.

Thinking thus, Lizzie looked around her, and the contrast between the after-lives of the two girls, could not but rise strongly before her. On retiring she sat down, as was her wont, to read a portion of Scripture, a practice acquired at boarding-school, and continued from respect to her teacher. It was the large family Bible, and had been her mother's. Turning to Ecclesiastes of the Apocrypha, she read for the first time these words:

"Prosperity and adversity, life and death, poverty and riches, come of the Lord."

They spoke like a spirit voice in answer to her thoughts. Never had the idea come home to her so entirely as now, that all she was and all she enjoyed, she owed to the goodness of God, and not to any merit of her own. We will not intrude upon her thoughts, for they were too sacred, and when at length she sought her pillow, it was in a more humble and serious frame of mind than for a long time before.

When Lizzie met her father at breakfast, it was with a kiss and a smile so sunny, that he could not help saying, "So, I suppose the new dress is fairly underway, you look so unusually joyful!" But she only answered with a knowing shake of the head.

It was the day before Christmas, and Lizzie had been out all the morning. She had been to the grocer's and ordered a basket full of packages of tea, coffee, and eatables, to be sent to Tom Flynn's family. Had sent an order to the wood-yard for a load of wood for them, and, accompanied by her house-keeper, had selected a joint of meat, with vegetables, for their Christmas dinner. But that fine turkey, the barrel of flour, and those two large mince pies, were sent to Mrs. Taylor, who little thought who the donor could be. Lizzie's purchases had been made out of the money which her father gave her for her ball dress, and though it was not half gone, there was not now enough for the dress; but Lizzie seemed to have forgotten that. Having purchased a few useful articles as Christmas gifts to the servants, she returned home apparently quite happy.

When the gas was lighted in the library, Lizzie descended with the slippers in hand, and opening

the door softly, before her father was aware of her presence, she placed the slippers on his feet saying, "See, papa, your Christmas gift!"

"Why, Lizzie! I thought you went to the ball.—What does this mean?"

"It means that I preferred to stay with you. But you don't say how you like the slippers."

"Why they're beauties! Warm as toast! But I don't see yet, why you didn't go. Have you and Ned quarrelled?"

Lizzie blushed, but answered frankly, "O, no; but when I came to think it over, I thought fifty dollars was a good deal to spend on one evening's amusement, so when Ned came to ask me, I told him I should be happy to go with him, but I had concluded to give up this ball. You see I have grown economical."

"Have? hey! Well, I can't see yet; but, however, where is the money?"

"Here it is, or most of it, I have spent part." As she spoke, she laid the bills on his knee.

"Come, pass, give an account of all this, for I know you keep something back."

Glad of a listener, Lizzie told the whole story, and when she had finished, her father wiped his eyes suspiciously, and said, "Here, child, take the money back, you use it better than I should. You haven't bought near enough. Don't you want to make this girl a Christmas present? I have it!—send her a note, telling her you heard from Mrs. Russell that they had returned to the city, and you wanted to spend the day with you to-morrow, then you can cheer her up so she will grow young fast."

Lizzie needed no second bidding. She wrote a kind note, referring to old times and associations, and assuring her poor friend of a cordial welcome. When her father had read the note, he said:—"But, Lizzie, child, there is one thing, perhaps she will not come. You know we live on Fifth Avenue, and in such style as befits our circumstances, and she may feel delicate about the contrast. Perhaps she has not clothes that are suitable. Now, I'll tell you what we had better do. It is not late, we will send the note by Timothy, and we will go out to-night and get some nice articles, and have them sent right away."

It was a new delight to Lizzie, and the enjoyment was doubled by her father's hearty participation.

The frosty air, the brilliantly lighted and thronged streets, the gay stores, and jingling sleigh-bells, all combined to furnish a scene so exciting as to make Lizzie's eyes dance, and her cheeks glow with animation. She could not have looked more beautiful at the ball, and I presume Ned Ritchie thought so, judging from the admiring look he gave her as he passed them. Lizzie was surprised to see him, and could not help wondering if he had absented himself on account of her refusal to accompany him to the ball.

That night a large bundle was left at the widow Taylor's for Mary. With eager, trembling hands, she untied the strings, wondering who could so befriended those who had long been nearly friendless. A warm blanket shawl, a woollen dress with materials for making, a worsted hood, and a pair of white mittens, two pairs of woollen stockings, and a piece of cotton cloth, comprised the contents. Poor girl! She was quite overcome, and had not recovered her composure when Lizzie's note was handed her. Having read it over and over again, she was half inclined to think that she had found out their benefactor, but still in doubt, she retired to rest with fervent prayers for whoever it might be.

Never had she spent so delightful a day as the Christmas which Lizzie and her father made "merry" for her. This was but the beginning of happy days for her, and she was no longer at a loss to know who were her secret friends.

And Lizzie was no less happy. It is a remarkable property of benevolence, that the more and the wider it is abroad, the more it returns to enrich and bless the heart of its possessor. Then Lizzie had another, though inferior, source of happiness, in the fact that her father told her, just before the holidays were over, that a young fellow named Edward Ritchie had been trying to coax his daughter away from him, and, really, the poor man seemed to want her so much, that he had fairly wrung a consent out of him.

CURIOSITIES OF THE EARTH.—At the city of Modena, in Italy, and about four miles around it, wherever the earth is dug, when the workmen arrive at a distance of sixty-three feet, they come to a bed of chalk, which they bore with an auger, five feet deep. They then withdraw from the pit before the auger is removed, and, upon its extraction, the water bursts up through the aperture with great violence, and quickly fills this newly-made well, which continues full, and is affected neither by rains nor drouths. But what is most remarkable in this operation is, the layers of earth as we descend. At the depth of fourteen feet are found the ruins of an ancient city, paved streets, houses, floors, and different pieces of mosaic work. Under this is found a soft oozy earth, made up of vegetables, and at twenty-six feet deep, large trees entire, such as walnut trees, with the walnuts still sticking to the stem, and the leaves and branches in a perfect state of preservation. At twenty-eight feet deep, a soft chalk is found, mixed with a vast quantity of shells, and this bed is eleven feet thick. Under this, vegetables are found again.—*Pittsburg Almanac.*

A FINE THOUGHT.—A Greek poet implies that the height of bliss is the sudden relief of pain: there is a nobler bliss still—the rapture of the conscience at the sudden release from a guilty thot.—*Bulwer Lytton.*

THE TRUE GENTLEMAN.—He is courteous and affable to his neighbors. As the sword of the best tempered metal is most flexible, so the truly generous are most pliant and courteous in their behavior to their inferiors.

SLOW AND SURE.
Be sure if you're slow, ever pay as you go;
You'll get along fast if you get along so;
The carve of the debtor you never will know,
While you can exclaim, "Not a man do I owe!"

Every man has just as much vanity as he wants understanding.

Corner for the Young.

[As the subject is again attracting attention, and being noticed in the papers, we re-publish the following for solution by the thousands who were not readers of the RURAL when it was first given—two or three years ago.]

ILLUSTRATED REBUS.

Answer in two weeks.
For Moore's Rural New-Yorker
MISCELLANEOUS ENIGMA.

I AM composed of 18 letters.
My 2, 6, 1, 3 is a kind of fruit.
My 9, 14, 8, 17, 3 is good to drink, but is not cider.
My 10, 11 is a conjunction.
My 15, 6, 1, 18 is what young ladies should be.
My 3, 4, 18, 6 is what young ladies should not be.
My 13, 14, 3, 8 is much disliked.
My 16, 17, 15, 8 is used by soldiers.
My 1, 7, 15, 14 is a lady's name.
My 14, 7, 5, 8, 12, 13 is a gentleman's name.
My 11, 1, 9, 7 is a young animal.

Young ladies now may try their skill,
For there's a way when there's a will—
My whole expresses an urgent need,
Felt by a farmer, lonely, indeed.

Lone Ridge, Iowa, 1858. FORLORN HOPE.

A RIDDLE.

THERE was a man of Adam's race,
Who had a certain dwelling place,
A home complete, well covered o'er,
Where no man dwelt since nor before.
'Twas not composed by human art,
Brick, stone, nor wood in any part;
Its windows bright, its structure neat,
Its parts were everywhere complete.
'Twas not on the hill, nor in the glen,
'Twas not in the air, nor yet among men,
'Twas neither in heaven, nor was it in hell,
But in a world where mortals dwell.

Avon Springs, N. Y., 1858. T. N. G.

Wit and Humor.

"CAPPING THE CLIMAX."—A certain political speaker was addressing a large audience in Virginia, and descending vehemently against proscription of foreigners, when his eye fell upon a little German Jew, a peddler of ready-made clothing, who seemed to be very much impressed with the argument of the orator, greedily swallowing up everything he uttered. This was too good an opportunity not to make the most of, and looking the little peddler full in the eye, he exclaimed:—"Furriner, didn't you come to this country to escape from tyrannical, down-trodden and oppressed Europe? Didn't you flee to these happy shores to live in a land of freedom, where the great right of suffrage is guaranteed to all? Didn't you, furriner?" He paused for a reply, when the little peddler squeaked out—"No, sir; I comes to dis country to sell cheap ready-made clothes."

The astonishment of the orator, the shouts and roars of the multitude, cannot be described. The speech was finished.

A PURGENT DIALOGUE.—Grocer—"Mr. Editor, I'll thank you to say that I keep the best groceries in the city."

Editor—"I'll thank you to supply my family with groceries gratis."

Grocer—"I thought you were glad to get something to fill up your paper."

Editor—"I thought you were glad to fill up store-rooms for nothing." It's a poor rule that won't work both ways.

Exit grocer in a rage, threatening to kill the paper.

"O, spare me, dear angel, one lock of your hair!"
A bashful young lover took courage and sighed.
"Twere a sin to refuse you so modest a prayer,
So take my whole wig," the sweet creature replied.

THE man who is too poor to take a weekly paper, has bought a slab-sided dog, an old shot-gun, and a twenty shilling gold watch. He educates his children in the street, and boards his shanghaies on his neighbors.

A DOCTOR and a military officer became enamored of the same lady. A friend inquired of her which of the two suitors she intended to favor. Her reply was that it was difficult for her to determine, as they were both such killing creatures.

A COUNTRY lad says his Uncle Ben made a scare-crow so very frightful that one of the black feathered thieves actually went and brought back all the corn he had stolen during several days.

"WHAT is a rebus?" I asked of dear Miss.
As close by my side the fair maiden was seated;
I saw her eyes sink and her countenance vary,
As she said in reply, "tis a kiss, sir, repeated."

A ROY'S definition of a proverb: "Spoil the rod and spare the child."

TERMS IN ADVANCE

TWO DOLLARS A YEAR—\$1 for six months. To Clubs and Agents as follows.—Three Copies one year, for \$5. Six Copies (one to Agent or getter up of Club) for \$10; Ten Copies (and one to Agent) for \$15; and any additional number at the same rate. (\$1.50 per copy.) As we are obliged to pre-pay the American postage on papers sent to the British Provinces, our Canadian agents and friends must add 12 1/2 cents per copy to the club rates for the RURAL. The lowest price of copies sent to Europe, &c., is \$2.00, including postage.

The Postage on the RURAL is only 3 1/2 cts per quarter to any part of this State, and 6 1/2 cts to any other State, if paid quarterly in advance at the post-office where received.

Advertising.—Brief and appropriate advertisements will be inserted at twenty-five cents a line, each insertion, payable in advance. Our rule is to give no advertisement unless very brief, more than four consecutive insertions. Patent Medicines, &c., are not advertised in the RURAL on any consideration.

THE MONEY WE RECEIVE.—Bills on all solvent Banks in the U. S. and Canada, taken at par on subscription to the RURAL, but our agents and other friends will please remit New York, New England or Canada money when convenient. Postage Stamps can be remitted for fractional parts of a dollar. For all amounts over \$15 we prefer Drafts on either New York, Philadelphia, Boston, Albany, Rochester or Buffalo (less exchange), payable to our order; and all our drafts may be mailed at the risk of the Publisher. If our friends throughout the Union, British Provinces, &c., will comply with these suggestions, so far as convenient, the favor will be appreciated.

THE RURAL is published strictly upon the CASH SYSTEM—copies are never mailed to individual subscribers until paid for, (or ordered by a responsible agent,) and always discontinued when the subscription term expires. Hence, a prompt renewal is necessary to secure the regular continuance of the paper.
